XVI. ARISTARCHUS OF SAMOS

(a) GENERAL

Aët. i. 15. 5 ; *Doxographi Graeci*, ed. Diels 313. 16-18

Ἀρίσταρχος Σάμιος μαθηματικὸς ἀκουστής
Στράτωνος φῶς εἶναι τὸ χρῶμα τοῖς ὑποκειμένοις
ἐπιπίπτον.

Archim. *Aren.* 1, Archim. ed. Heiberg ii. 218. 7-18

Ἀρίσταρχος δὲ ὁ Σάμιος ὑποθεσίῳ τινῶν ἐξ-
έδωκεν γραφάς, ἐν αἷς ἐκ τῶν ὑποκειμένων συμ-
βαίνει τὸν κόσμον πολλαπλάσιον εἶμεν τοῦ νῦν
εἰρημένου. ὑποτίθεται γὰρ τὰ μὲν ἀπλῶνέα τῶν
ἄστρον καὶ τὸν ἄλιον μένειν ἀκίνητον, τὰν δὲ γᾶν
περιφέρεσθαι περὶ τὸν ἄλιον κατὰ κύκλου περι-
φέρειαν, ὅς ἐστιν ἐν μέσῳ τῷ δρόμῳ κείμενος,
τὰν δὲ τῶν ἀπλανέων ἄστρον σφαῖραν περὶ τὸ

^a Strato of Lampsacus was head of the Lyceum from 288/287 to 270/269 B.C. The next extract shows that Aristarchus formulated his heliocentric hypothesis before Archimedes wrote the *Sand-Reckoner*, which can be shown to have been written before 216 B.C. From Ptolemy, *Syntaxis* iii. 2, Aristarchus is known to have made an observation of the summer solstice in 281/280 B.C. He is ranked by Vitruvius, *De Architectura* i. 1. 17 among those rare men, such as Philolaus, Archytas, Apollonius, Eratosthenes,

XVI. ARISTARCHUS OF SAMOS

(a) GENERAL

Aëtius i. 15. 5; *Doxographi Graeci*, ed. Diels 313. 16-18

ARISTARCHUS of Samos, a mathematician and pupil of Strato,^a held that colour was light impinging on a substratum.

Archimedes, *Sand-Reckoner* 1, Archim. ed. Heiberg
ii. 218. 7-18

Aristarchus of Samos produced a book based on certain hypotheses, in which it follows from the premises that the universe is many times greater than the universe now so called. His hypotheses are that the fixed stars and the sun remain motionless, that the earth revolves in the circumference of a circle about the sun, which lies in the middle of the orbit, and that the sphere of the fixed stars, situated

Archimedes and Scopinas of Syracuse, who were equally proficient in all branches of science. Vitruvius, *loc. cit.* ix. 8. 1, is also our authority for believing that he invented a sun-dial with a hemispherical bowl. His greatest achievement, of course, was the hypothesis that the earth moves round the sun, but as that belongs to astronomy it can be mentioned only casually here. A full and admirable discussion will be found in Heath, *Aristarchus of Samos: The Ancient Copernicus*, together with a critical text of Aristarchus's only extant work.

GREEK MATHEMATICS

αὐτὸ κέντρον τῷ ἄλλῳ κειμέναν τῷ μεγέθει ταλικαύταν εἶμεν, ὥστε τὸν κύκλον, καθ' οὗ τὰν γῶν ὑποτίθεται περιφέρεισθαι, τοιαύταν ἔχει ἀναλογίαν ποτὶ τὰν τῶν ἀπλανέων ἀποστασίαν, οἷαν ἔχει τὸ κέντρον τᾶς σφαίρας ποτὶ τὰν ἐπιφάνειαν.

Plut. *De facie in orbe lunae* 6, 922 v-923 A

Καὶ ὁ Λεύκιος γελάσας, "Μόνον," εἶπεν, "ὦ τάν, μὴ κρῖσκν ἡμῖν ἀσεβείας ἐπαγγελίης, ὥσπερ Ἀρίσταρχον ᾤετο δεῖν Κλεάνθης τὸν Σάμιον ἀσεβείας προσκαλεῖσθαι τοὺς Ἕλληνας, ὡς κινούντα τοῦ κόσμου τὴν ἐστίαν, ὅτι τὰ φαινόμενα σώζειν ἀνὴρ ἐπειράτο, μένειν τὸν οὐρανὸν ὑποτιθέμενος, ἐξελίττεσθαι δὲ κατὰ λοξοῦ κύκλου τὴν γῆν, ἅμα καὶ περὶ τὸν αὐτῆς ἄξονα δινουμένην."

(b) DISTANCES OF THE SUN AND MOON

Aristarch. Sam. *De Mag. et Dist. Solis et Lunae*, ed. Heath (*Aristarchus of Samos: The Ancient Copernicus*) 352. 1-354. 6

<ὑποθέσεις¹>

α'. Τὴν σελήνην παρὰ τοῦ ἡλίου τὸ φῶς λαμβάνειν.

β'. Τὴν γῆν σημείου τε καὶ κέντρου λόγον ἔχειν πρὸς τὴν τῆς σελήνης σφαῖραν.

γ'. Ὅταν ἡ σελήνη διχότομος ἡμῖν φαίνεται,

¹ ὑποθέσεις add. Heath.

^a Aristarchus's last hypothesis, if taken literally, would mean that the sphere of the fixed stars is infinite. All that he implies, however, is that in relation to the distance of the

ARISTARCHUS OF SAMOS

about the same centre as the sun, is so great that the circle in which he supposes the earth to revolve has such a proportion to the distance of the fixed stars as the centre of the sphere bears to its surface.^a

Plutarch, *On the Face in the Moon* 6, 922 F-923 A

Lucius thereupon laughed and said : " Do not, my good fellow, bring an action against me for impiety after the manner of Cleanthes, who held that the Greeks ought to indict Aristarchus of Samos on a charge of impiety because he set in motion the hearth of the universe ; for he tried to save the phenomena by supposing the heaven to remain at rest, and the earth to revolve in an inclined circle, while rotating at the same time about its own axis." ^b

(b) DISTANCES OF THE SUN AND MOON

Aristarchus of Samos, *On the Sizes and Distances of the Sun and Moon*, ed. Heath (*Aristarchus of Samos : The Ancient Copernicus*) 352. 1-354. 6

HYPOTHESES

1. The moon receives its light from the sun.
2. The earth has the relation of a point and centre to the sphere in which the moon moves.^c
3. When the moon appears to us halved, the great

fixed stars the diameter of the earth's orbit may be neglected. The phrase appears to be traditional (v. Aristarchus's second hypothesis, *infra*).

^b Heraclides of Pontus (along with Ecphantus, a Pythagorean) had preceded Aristarchus in making the earth revolve on its own axis, but he did not give the earth a motion of translation as well.

^c Lit. " sphere of the moon."

GREEK MATHEMATICS

νεύειν εἰς τὴν ἡμετέραν ὄψιν τὸν διορίζοντα τό τε σκιερὸν καὶ τὸ λαμπρὸν τῆς σελήνης μέγιστον κύκλον.

δ'. Ὅταν ἡ σελήνη διχότομος ἡμῖν φαίνεται, τότε αὐτὴν ἀπέχει τοῦ ἡλίου ἑλασσον τεταρτημορίου τῷ τοῦ τεταρτημορίου τριακοστῷ.

ε'. Τὸ πῆς σκιᾶς πλάτος σεληνῶν εἶναι δύο.

ς'. Τὴν σελήνην ὑποτείνειν ὑπὸ πεντεκαιδέκατον μέρος ζωδίου.

Ἐπιλογίζεται οὖν τὸ τοῦ ἡλίου ἀπόστημα ἀπὸ τῆς γῆς τοῦ τῆς σελήνης ἀποστήματος μείζον μὲν ἢ ὀκτωκαιδεκαπλάσιον, ἑλασσον δὲ ἢ εἰκοσάπλάσιον, διὰ τῆς περὶ τὴν διχοτομίαν ὑποθέσεως τὸν αὐτὸν δὲ λόγον ἔχειν τὴν τοῦ ἡλίου διάμετρον πρὸς τὴν τῆς σελήνης διάμετρον. τὴν δὲ τοῦ ἡλίου διάμετρον πρὸς τὴν τῆς γῆς διάμετρον μείζονα μὲν λόγον ἔχειν ἢ ὅν τὰ $\iota\theta$ πρὸς γ , ἐλάσσονα δὲ ἢ ὅν $\mu\gamma$ πρὸς ϵ , διὰ τοῦ εὐρεθέντος περὶ τὰ ἀποστήματα λόγου, τῆς $\langle\tau\epsilon^1\rangle$ περὶ τὴν σκιὰν ὑποθέσεως, καὶ τοῦ τὴν σελήνην ὑπὸ πεντεκαιδέκατον μέρος ζωδίου ὑποτείνειν.

Ibid., Prop. Γ , ed. Heath 376. 1-380. 28

Τὸ ἀπόστημα ὃ ἀπέχει ὁ ἥλιος ἀπὸ τῆς γῆς τοῦ

¹ $\tau\epsilon$ add. Heath.

^a Lit. "verges towards our eye." For "verging," v. vol. i. p. 244 n. a. Aristarchus means that the observer's eye lies in the plane of the great circle in question. A great circle is a circle described on the surface of the sphere and having the same centre as the sphere; as the Greek implies, a great circle is the "greatest circle" that can be described on the sphere.

ARISTARCHUS OF SAMOS

circle dividing the dark and the bright portions of the moon is in the direction of our eye.^a

4. When the moon appears to us halved, its distance from the sun is less than a quadrant by one-thirtieth of a quadrant.^b

5. The breadth of the earth's shadow is that of two moons.^c

6. The moon subtends one-fifteenth part of a sign of the zodiac.^d

It may now be proved that *the distance of the sun from the earth is greater than eighteen times, but less than twenty times, the distance of the moon*—this follows from the hypothesis about the halved moon; that *the diameter of the sun has the aforesaid ratio to the diameter of the moon*; and that *the diameter of the sun has to the diameter of the earth a ratio which is greater than 19 : 3 but less than 43 : 6*—this follows from the ratio discovered about the distances, the hypothesis about the shadow, and the hypothesis that the moon subtends one-fifteenth part of a sign of the zodiac.

Ibid., Prop. 7, ed. Heath 376. 1-380. 28

The distance of the sun from the earth is greater than

^b i.e., is less than 90° by 3° , and so is 87° . The true value is $89^\circ 50'$.

^c i.e., the breadth of the earth's shadow where the moon traverses it during an eclipse. The figure is presumably based on records of eclipses. Hipparchus made the figure $2\frac{1}{2}$ for the time when the moon is at its mean distance, and Ptolemy a little less than $2\frac{1}{2}$ for the time when the moon is at its greatest distance.

^d i.e., the angular diameter of the moon is one-fifteenth of $30''$, or $2''$. The true value is about $\frac{1}{2}''$, and in the *Sand-Reckoner* (Archim. ed. Heiberg ii, 222, 6-8) Archimedes says that Aristarchus "discovered that the sun appeared to be about $\frac{1}{70}$ th part of the circle of the Zodiac"; as he believed

GREEK MATHEMATICS

ἀποστήματος οὗ ἀπέχει ἡ σελήνη ἀπὸ τῆς γῆς
μείζον μὲν ἐστὶν ἢ ὀκτωκαιδεκαπλάσιον, ἔλασσον
δὲ ἢ εἰκοσαπλάσιον.

Ἐστω γὰρ ἡλίου μὲν κέντρον τὸ Α, γῆς δὲ τὸ
Β, καὶ ἐπιζευχθεῖσα ἡ ΑΒ ἐκβεβλήσθω, σελήνης

τομὴν ἐν τῇ σφαίρᾳ, καθ' ἧς φέρεται τὸ κέντρον
τοῦ ἡλίου, μέγιστον κύκλον τὸν ΑΔΕ, καὶ ἐπ-
εξεύχθωσαν αἱ ΑΓ, ΓΒ, καὶ ἐκβεβλήσθω ἡ ΒΓ
ἐπὶ τὸ Δ.

Ἔσται δὴ, διὰ τοῦτο τὸ Γ σημεῖον κέντρον εἶναι
τῆς σελήνης διχοτόμου οὔσης, ὁρθὴ ἡ ὑπὸ τῶν

that the sun and moon had the same angular diameter he must, therefore, have found the approximately correct angular diameter of $\frac{1}{2}^\circ$ after writing his treatise *On the Sizes and Distances of the Sun and Moon*.

ARISTARCHUS OF SAMOS

eighteen times, but less than twenty times, the distance of the moon from the earth.

For let A be the centre of the sun, B that of the earth; let AB be joined and produced; let I' be the centre of the moon when halved; let a plane be drawn through AB and I', and let the section made by it in the sphere on which the centre of the sun moves be the great circle $\Lambda\Delta E$, let AI', I'B be joined, and let BI' be produced to Δ .

Then, because the point I' is the centre of the moon when halved, the angle A'I'B will be right.

ΑΓΒ. ἤχθω δὴ ἀπὸ τοῦ Β τῇ ΒΑ πρὸς ὀρθὰς ἢ ΒΕ. ἔσται δὴ ἡ ΕΔ περιφέρεια τῆς ΕΔΑ περιφερείας λ'. ὑπόκειται γάρ, ὅταν ἡ σελήνη διχότομος ἡμῖν φαίνεται, ἀπέχειν ἀπὸ τοῦ ἡλίου ἔλασσον τεταρτημορίου τῷ τοῦ τεταρτημορίου λ'. ὥστε καὶ ἡ ὑπὸ τῶν ΕΒΓ γωνία ὀρθῆς ἐστὶ λ'. συμπεπληρώσθω δὴ τὸ ΑΕ παραλληλόγραμμον, καὶ ἐπεζεύχθω ἡ ΒΖ. ἔσται δὴ ἡ ὑπὸ τῶν ΖΒΕ γωνία ἡμίσεια ὀρθῆς. τετμήσθω ἡ ὑπὸ τῶν ΖΒΕ γωνία δίχα τῇ ΒΗ εὐθείᾳ. ἡ ἄρα ὑπὸ τῶν ΗΒΕ γωνία τέταρτον μέρος ἐστὶν ὀρθῆς. ἀλλὰ καὶ ἡ ὑπὸ τῶν ΔΒΕ γωνία λ' ἐστὶ μέρος ὀρθῆς. λόγος ἄρα τῆς ὑπὸ τῶν ΗΒΕ γωνίας πρὸς τὴν ὑπὸ τῶν ΔΒΕ γωνίαν (ἐστὶν¹) ὃν (ἔχει²) τὰ $\alpha\epsilon$ πρὸς τὰ δύο. οἷων γάρ ἐστὶν ὀρθὴ γωνία ξ , τοιούτων ἐστὶν ἡ μὲν ὑπὸ τῶν ΗΒΕ $\alpha\epsilon$, ἡ δὲ ὑπὸ τῶν ΔΒΕ δύο. καὶ ἐπεὶ ἡ ΗΕ πρὸς τὴν ΕΘ μείζονα λόγον ἔχει ἥπερ ἡ ὑπὸ τῶν ΗΒΕ γωνία πρὸς τὴν ὑπὸ τῶν ΔΒΕ γωνίαν, ἡ ἄρα ΗΕ πρὸς τὴν ΕΘ³ μείζονα λόγον ἔχει ἥπερ τὰ $\alpha\epsilon$ πρὸς τὰ $\beta\epsilon$. καὶ ἐπεὶ ἴση ἐστὶν ἡ ΒΕ τῇ ΕΖ, καὶ ἐστὶν ὀρθὴ ἡ πρὸς τῷ Ε, τὸ ἄρα ἀπὸ τῆς ΖΒ τοῦ ἀπὸ ΒΕ διπλάσιόν ἐστιν. ὡς δὲ τὸ ἀπὸ ΖΒ πρὸς τὸ ἀπὸ ΒΕ, οὕτως ἐστὶ τὸ ἀπὸ ΖΗ πρὸς τὸ ἀπὸ ΗΕ. τὸ ἄρα ἀπὸ ΖΗ τοῦ ἀπὸ ΗΕ διπλάσιόν ἐστι. τὰ δὲ $\mu\theta$ τῶν $\kappa\epsilon$ ἐλάσσονά ἐστιν ἢ διπλάσια, ὥστε τὸ ἀπὸ ΖΗ πρὸς τὸ ἀπὸ ΗΕ μείζονα λόγον ἔχει ἢ (ὃν τὰ³) $\mu\theta$ πρὸς $\kappa\epsilon$. καὶ ἡ ΖΗ ἄρα πρὸς τὴν ΗΕ μείζονα λόγον

¹ ἐστὶν add. Nizze.² ἔχει add. Wallis.³ ὃν τὰ add. Wallis.

^a Lit. "circumference," as in several other places in this proposition.

ARISTARCHUS OF SAMOS

From B let BE be drawn at right angles to BA. Then the arc^a EΔ will be one-thirtieth of the arc EΔA; for, by hypothesis, when the moon appears to us halved, its distance from the sun is less than a quadrant by one-thirtieth of a quadrant [Hypothesis 4]. Therefore the angle EBF is also one-thirtieth of a right angle. Let the parallelogram AE be completed, and let BZ be joined. Then the angle ZBE will be one-half of a right angle. Let the angle ZBE be bisected by the straight line BII; then the angle HBE is one-fourth part of a right angle. But the angle ΔBE is one-thirtieth part of a right angle; therefore angle HBE : angle ΔBE = 15 : 2; for, of those parts of which a right angle contains 60, the angle HBE contains 15 and the angle ΔBE contains 2.

Now since

$$HE : E\Theta > \text{angle HBE} : \text{angle } \Delta BE,^b$$

therefore $HE : E\Theta > 15 : 2$.

And since $BE = EZ$, and the angle at E is right, therefore

$$ZB^2 = 2BE^2.$$

But

$$ZB^2 : BE^2 = ZH^2 : HE^2.$$

Therefore

$$ZH^2 = 2HE^2.$$

Now

$$49 < 2 \cdot 25,$$

so that

$$ZH^2 : HE^2 > 49 : 25.$$

Therefore

$$ZH : HE > 7 : 5.$$

^a Aristarchus's assumption is equivalent to the theorem

$$\frac{\tan \alpha}{\tan \beta} > \frac{\alpha}{\beta},$$

where $\beta < \alpha \leq \frac{1}{2}\pi$. Euclid's proof in *Optics* 8 is given in vol. I. pp. 502-505.

¹ $\delta\upsilon$ add. Wallis.

² τὰ add. Wallis.

ARISTARCHUS OF SAMOS

Therefore, *componendo*, $ZE : EH > 12 : 5$,
that is, $ZE : EH > 36 : 15$.

But it was also proved that

$$HE : EO > 15 : 2.$$

Therefore, *ex aequali*,^a $ZE : EO > 36 : 2$,
that is, $ZE : EO > 18 : 1$.

Therefore ZE is greater than eighteen times EO. And ZE is equal to BE. Therefore BE is also greater than eighteen times EO. Therefore BH is much greater than eighteen times OE.

But $BO : OE = AB : BF$,

by similarity of triangles. Therefore AB is also greater than eighteen times BF. And AB is the distance of the sun from the earth, while FB is the distance of the moon from the earth; therefore the distance of the sun from the earth is greater than eighteen times the distance of the moon from the earth.

I say now that it is less than twenty times. For through Δ let ΔK be drawn parallel to EB, and about the triangle ΔKB let the circle ΔKB be drawn; its diameter will be ΔB , by reason of the angle at K being right. Let BA, the side of a hexagon, be fitted into the circle. Then, since the angle ΔBE is one-thirtieth of a right angle, therefore the angle ΔBK is also one-thirtieth of a right angle. Therefore the arc BK is one-sixtieth of the whole circle. But BA is one-sixth part of the whole circle.

Therefore arc BA = 10 . arc BK.

And the arc BA has to the arc BK a ratio greater

^a For the proportion *ex aequali*, v. vol. I. pp. 448-451.

εὐθεία πρὸς τὴν ΒΚ εὐθείαν· ἡ ἄρα ΒΛ εὐθεία τῆς ΒΚ εὐθείας ἐλάσσων ἐστὶν ἢ ἰ. καὶ ἔστιν αὐτῆς διπλῇ ἢ ΒΔ· ἡ ἄρα ΒΔ τῆς ΒΚ ἐλάσσων ἐστὶν ἢ $\bar{\kappa}$. ὥς δὲ ἡ ΒΔ πρὸς τὴν ΒΚ, ἡ ΑΒ πρὸς <τὴν¹> ΒΓ, ὥστε καὶ ἡ ΑΒ τῆς ΒΓ ἐλάσσων ἐστὶν ἢ $\bar{\kappa}$. καὶ ἔστιν ἡ μὲν ΑΒ τὸ ἀπόστημα ὃ ἀπέχει ὁ ἥλιος ἀπὸ τῆς γῆς, ἡ δὲ ΒΓ τὸ ἀπόστημα ὃ ἀπέχει ἡ σελήνη ἀπὸ τῆς γῆς· τὸ ἄρα ἀπόστημα ὃ ἀπέχει ὁ ἥλιος ἀπὸ τῆς γῆς τοῦ ἀποστήματος, οὗ ἀπέχει ἡ σελήνη ἀπὸ τῆς γῆς, ἐλασσόν ἐστὶν ἢ $\bar{\kappa}$. ἐδείχθη δὲ καὶ μείζον ἢ $\bar{\iota\eta}$.

Ἔχει δὲ καὶ ὁ $\overset{\zeta\rho\omicron\epsilon}{M}$ $\overset{\sigma\rho\omicron\gamma}{\epsilon\omega\omicron\epsilon}$ πρὸς $\overset{\sigma}{M}$ $\overset{\sigma}{\epsilon\phi}$ μείζονα λόγον ἢ ὃν τὰ $\overline{\mu\gamma}$ πρὸς $\overline{\lambda\zeta}$.

¹ $\pi\eta$ add. Wallis.

^a This is proved in Ptolemy's *Syntaxis* i. 10, v. *infra*, pp. 435-439.

^b If $\frac{7921}{4050}$ is developed as a continued fraction, we obtain the approximation $1 + \frac{1}{1 + \frac{1}{21 + \frac{1}{2}}}$, which is $\frac{88}{45}$. Similarly, if $\frac{71755875}{61735500}$ or $\frac{21261}{18292}$ is developed as a continued fraction, we

ARISTARCHUS OF SAMOS

than that which the straight line BA has to the straight line BK .^a

Therefore $BA < 10 \cdot BK$.

And $B\Delta = 2 \cdot BA$.

Therefore $B\Delta < 20 \cdot BK$.

But $B\Delta : BK = AB : B\Gamma$.

Therefore $AB < 20 \cdot B\Gamma$.

And AB is the distance of the sun from the earth, while $B\Gamma$ is the distance of the moon from the earth; therefore the distance of the sun from the earth is less than twenty times the distance of the moon from the earth. And it was proved to be greater than eighteen times.

(c) CONTINUED FRACTIONS (?)

Ibid., Prop. 13, ed. Heath 396. 1-2

But 7921 has to 4050 a ratio greater than that which 88 has to 45.

 Ὁ γέρων πάλιν ἅπαντας ποιεῖ Συρακουσίους

^a A life of Archimedes was written by a certain Heraclides—perhaps the Heraclides who is mentioned by Archimedes himself in the preface to his book *On Spirals* (Archim. ed. Heiberg ii. 2. 3) as having taken his books to Dositheus. We know this from two references by Eutocius (Archim. ed. Heiberg iii. 228. 20, Apollon. ed. Heiberg ii. 168. 3, where, however, the name is given as Ἡράκλειος), but it has not survived. The surviving writings of Archimedes, together with the commentaries of Eutocius of Ascalon (fl. A.D. 520), have been edited by J. L. Heiberg in three volumes of the Teubner series (references in this volume are to the 2nd ed., Leipzig, 1910-1915). They have been put into mathematical notation by T. L. Heath, *The Works of Archimedes* (Cam-

XVII. ARCHIMEDES ^a

(a) GENERAL

Tzetzes, *Book of Histories* ii. 103-144 ^b

ARCHIMEDES the wise, the famous maker of engines, was a Syracusan by race, and worked at geometry till old age, surviving five-and-seventy-years ^c; he reduced to his service many mechanical powers, and with his triple-pulley device, using only his left hand, he drew a vessel of fifty thousand medimni burden. Once, when Marcellus, the Roman general, was assaulting Syracuse by land and sea, first by his engines he drew up some merchant-vessels, lifted them up against the wall of Syracuse, and sent them in a heap again to the bottom, crews and all. When Marcellus had withdrawn his ships a little distance, the old man gave all the Syracusans power to lift

bridge, 1897), supplemented by *The Method of Archimedes* (Cambridge, 1922), and have been translated into French by Paul Ver Eecke, *Les Œuvres complètes d'Archimède* (Brussels, 1921).

^b The lines which follow are an example of the "political" (πολιτικός, popular) verse which prevailed in Byzantine times. The name is given to verse composed by accent instead of quantity, with an accent on the last syllable but one, especially an iambic verse of fifteen syllables. The twelfth-century Byzantine pedant, John Tzetzes, preserved in his *Book of Histories* a great treasure of literary, historical, theological and scientific detail, but it needs to be used with caution. The work is often called the *Chiliades* from its arbitrary division by its first editor (N. Gerbel, 1546) into books of 1000 lines each—it actually contains 12,674 lines.

^c As he perished in the sack of Syracuse in 212 B.C., he was therefore born about 287 B.C.

 " Πᾶ βῶ, καὶ χαριστίωνι τὰν γὰν κινήσω πᾶσαν."

¹ πέμποντας Cury, πέμποντα codd.

^a Unfortunately, the earliest authority for this story is Lucian, *Hipp.* 2: τὸν δὲ (sc. Ἀρχιμήδην) τὰς τῶν πολεμίων τριήρεις καταφλέξαντα τῇ τέχνῃ. It is also found in Galen, *Περὶ κρασ.* iii. 2, and Zonaras xiv. 3 relates it on the authority of Dion Cassius, but makes Proclus the hero of it.

^b Further evidence is given by Tzetzes, *Chil.* xii. 995 and Eutocius (Archim., ed. Heiberg iii. 132. 5-6) that Archimedes wrote in the Doric dialect, but the extant text of his best-known works. *On the Sphere and Cylinder* and the *Measurement of a Circle*, retains only one genuine trace of its original Doric—the form *τῆνον*. Partial losses have occurred in other books, the *Sand-Reckoner* having suffered least. The subject is fully treated by Heiberg, *Quaestiones Archimedeae*, pp. 69-94, and in a preface to the second volume of his edition of Archimedes he indicates the words which he has restored to their Doric form despite the manuscripts; his text is adopted in this selection.

The loss of the original Doric is not the only defect in the

ARCHIMEDES

stones large enough to load a waggon and, hurling them one after the other, to sink the ships. When Marcellus withdrew them a bow-shot, the old man constructed a kind of hexagonal mirror, and at an interval proportionate to the size of the mirror he set similar small mirrors with four edges, moved by links and by a form of hinge, and made it the centre of the sun's beams—its noon-tide beam, whether in summer or in mid-winter. Afterwards, when the beams were reflected in the mirror, a fearful kindling of fire was raised in the ships, and at the distance of a bow-shot he turned them into ashes.^a In this way did the old man prevail over Marcellus with his weapons. In his Doric ^b dialect, and in its Syracusan variant, he declared: "If I have somewhere to stand, I will move the whole earth with my *chariston*."^c

text. The hand of an interpolator—often not particularly skilful—can be repeatedly detected, and there are many loose expressions which Archimedes would not have used, and occasional omissions of an essential step in his argument. Sometimes the original text can be inferred from the commentaries written by Eutocius, but these extend only to the books *On the Sphere and Cylinder*, the *Measurement of a Circle*, and *On Plane Equilibria*. A partial loss of Doric forms had already occurred by the time of Eutocius, and it is believed that the works most widely read were completely recast a little later in the school of Isidorus of Miletus to make them more easily intelligible to pupils.

^a The instrument is otherwise mentioned by Simplicius (*in Aristot. Phys.*, ed. Diels 1110. 2-5) and it is implied that it was used for weighing: ταύτη δὲ τῇ ἀναλογίᾳ τοῦ κινουμένου καὶ τοῦ διαστήματος τὸ σταθμιστικὸν ὄργανον τὸν καλούμενον χαριτίωνα εὐστήσας ὁ Ἀρχιμήδης ὡς μέχρι παντός τῆς ἀναλογίας προχωρούσης ἐκόμψασεν ἐκέينو τὸ "πᾶ βῶ καὶ κινῶ τὰν γᾶν." As Tzetzes in another place (*Chil.* iii. 61: ὁ γῆν ἀνασπῶν μηχανῇ τῇ τρισπᾶστω βοῶν "ὅπα βῶ καὶ σαλεύσω τὴν χθόνα") writes of a triple-pulley device in the same connexion, it may be presumed to have been of this nature.

^c Zonaras ix. 5 adds that when he heard the enemy were

ARCHIMEDES

Whether, as Diodorus^a asserts, Syracuse was betrayed and the citizens went in a body to Marcellus, or, as Dion^b tells, it was plundered by the Romans, while the citizens were keeping a night festival to Artemis, he died in this fashion at the hands of one of the Romans. He was stooping down, drawing some diagram in mechanics, when a Roman came up and began to drag him away to take him prisoner. But he, being wholly intent at the time on the diagram, and not perceiving who was tugging at him, said to the man: "Stand away, fellow, from my diagram."^c As the man continued pulling, he turned round and, realizing that he was a Roman, he cried, "Somebody give me one of my engines." But the Roman, scared, straightway slew him, a feeble old man but wonderful in his works.

Plutarch, *Marcellus* xiv. 7-xvii. 7

Archimedes, who was a kinsman and friend of King Hiero, wrote to him that with a given force it was possible to move any given weight; and emboldened, as it is said, by the strength of the proof, he averred that, if there were another world and he could go to it, he would move this one. Hiero was amazed and besought him to give a practical demonstration of the problem and show some great object moved by a small force; he thereupon chose a three-masted merchantman among the king's ships which had been hauled ashore with great labour by a large band of men, and after putting on board many men and the usual cargo, sitting some distance away and without any special effort, he pulled gently with his hand at

coming "πὰρ κεφαλάν" ἔφη "καὶ μὴ παρὰ γραμμάν"—"Let them come at my head," he said, "but not at my line."

ἡρέμα τῇ χειρὶ σείων ἀρχὴν τινα πολυσπάστου προσηγάγετο λείως καὶ ἀπταιστως καὶ ὥσπερ διὰ θαλάττης ἐπιθέουσαν. ἐκπλαγεῖς οὖν ὁ βασιλεὺς καὶ συννοήσας τῆς τέχνης τὴν δύναμιν, ἔπεισε τὸν Ἀρχιμήδην ὅπως αὐτῷ τὰ μὲν ἀμυνόμενῳ, τὰ δ' ἐπιχειροῦντι μηχανήματα κατασκευάσῃ πρὸς πᾶσαν ἰδέαν πολιορκίας, οἷς αὐτὸς μὲν οὐκ ἐχρήσατο, τοῦ βίου τὸ πλείστον ἀπόλεμον καὶ πανηγυρικὸν βιώσας, τότε δ' ὑπῆρχε τοῖς Συρακουσίοις εἰς δέον ἢ παρασκευὴ καὶ μετὰ τῆς παρασκευῆς ὁ δημιουργός.

Ὡς οὖν προσέβαλον οἱ Ῥωμαῖοι διχόθεν, ἐκπληξίς ἦν τῶν Συρακουσίων καὶ σιγὴ διὰ δέος, μηδὲν ἂν ἀνθέξῃ πρὸς βίαν καὶ δύναμιν οἰομένων τοσαύτην. σχάσαντος δὲ τὰς μηχανὰς τοῦ Ἀρχιμήδους ἅμα τοῖς μὲν πεζοῖς ἀπῆντα τοξεύματά τε παντοδαπὰ καὶ λίθων ὑπέρογκα μεγέθη, ροίζῳ καὶ τάχει καταφερομένων ἀπίστῳ, καὶ μηδενὸς ὅλως τὸ βριθὸς στέγοντος ἀθρόους ἀνατρεπόντων τοὺς ὑποπίπτοντας καὶ τὰς τάξεις συγχρόντων, ταῖς δὲ ναυσὶν ἀπὸ τῶν τειχῶν ἄφνω ὑπεραιωρούμεναι κεραλαὶ τὰς μὲν ὑπὸ βριθοῦς στηρίζοντος ἄνωθεν ὠθοῖσαι κατ'έδυνον εἰς βυθόν, τὰς δὲ χερσὶ σιδηραῖς ἢ στόμασιν εἰκασμένοις γεράνων ἀνασπῶσαι πρῶραθεν ὀρθὰς ἐπὶ πρύμναν ἐβάπτιζον,

^a πολυσπάστος. Galen, in Hipp. De Artic. iv. 47 uses the same word. Tzetzes (*loc. cit.*) speaks of a triple-pulley device (τῇ τρισπάστῳ μηχανῇ) in the same connexion, and Oribasius, *Coll. med.* xlix. 22 mentions the τρισπαστος as an invention of Archimedes; he says that it was so called because it had three ropes, but Vitruvius says it was thus named because it had three wheels. Athenaeus v. 207 a-b says that a *helix* was used. Heath, *The Works of Archimedes*,

ARCHIMEDES

the end of a compound pulley ^a and drew the vessel smoothly and evenly towards himself as though she were running along the surface of the water. Astonished at this, and understanding the power of his art, the king persuaded Archimedes to construct for him engines to be used in every type of siege warfare, some defensive and some offensive ; he had not himself used these engines because he spent the greater part of his life remote from war and amid the rites of peace, but now his apparatus proved of great advantage to the Syracusans, and with the apparatus its inventor.^b

Accordingly, when the Romans attacked them from two elements, the Syracusans were struck dumb with fear, thinking that nothing would avail against such violence and power. But Archimedes began to work his engines and hurled against the land forces all sorts of missiles and huge masses of stones, which came down with incredible noise and speed ; nothing at all could ward off their weight, but they knocked down in heaps those who stood in the way and threw the ranks into disorder. Furthermore, beams were suddenly thrown over the ships from the walls, and some of the ships were sent to the bottom by means of weights fixed to the beams and plunging down from above ; others were drawn up by iron claws, or crane-like beaks, attached to the prow and were

p. xx, suggests that the vessel, once started, was kept in motion by the system of pulleys, but the first impulse was given by a machine similar to the *κοχλίας* described by Pappus viii. ed. Hultsch 1066, 1108 ff., in which a cog-wheel with oblique teeth moves on a cylindrical helix turned by a handle.

^b Similar stories of Archimedes' part in the defence are told by Polybius viii. 5. 3-5 and Livy xxiv. 34.

ἡ δι' ἀντιτόνων ἔνδον ἐπιστρεφόμεναι καὶ περιαγόμεναι τοῖς ὑπὸ τὸ τεῖχος πεφυκίوسي κρημνοῖς καὶ σκοπέλοις προσήρασσον, ἅμα φθόρῳ πολλῷ τῶν ἐπιβατῶν συντριβομένων. πολλάκις δὲ μετέωρος ἐξαρθεῖσα ναὺς ἀπὸ τῆς θαλάσσης δεῦρο καέκεισε περιδινουμένη καὶ κρεμαμένη θέαμα φρικῶδες ἦν, μέχρι οὗ τῶν ἀνδρῶν ἀπορριφέντων καὶ διασφενδονῆθέντων κενὴ προσπέσοι τοῖς τείχεσιν ἢ περιολίσθοι τῆς λαβῆς ἀνείσης. ἦν δὲ ὁ Μάρκελλος ἀπὸ τοῦ ζεύγματος ἐπῆγε μηχανήν, σαμβύκη μὲν ἐκαλεῖτο δι' ὁμοιότητά τινα σχήματος πρὸς τὸ μουσικὸν ὄργανον, ἔτι δὲ ἄπῳθεν αὐτῆς προσφερομένης πρὸς τὸ τεῖχος ἐξήλατο λίθος δεκατάλαντος ὀλκήν, εἶτα ἕτερος ἐπὶ τούτῳ καὶ τρίτος, ὧν οἱ μὲν αὐτῇ¹ ἐμπεσόντες μεγάλῳ κτύπῳ καὶ κλύδωνι τῆς μηχανῆς τήν τε βάσιν συνηλόησαν καὶ τὸ γόμφωμα διέσεισαν καὶ διέσπασαν τοῦ ζεύγματος, ὥστε τὸν Μάρκελλον ἀπορούμενον αὐτόν, τε ταῖς ναυσὶν ἀποπλεῖν κατὰ τάχος καὶ τοῖς πεζοῖς ἀναχώρησιν παρεγγυῆσαι.

Βουλευομένοις δὲ ἔδοξεν αὐτοῖς ἔτι νυκτός, ἂν δύνωνται, προσμῖξαι τοῖς τείχεσι· τοὺς γὰρ τόνους, οἷς χρῆσθαι τὸν Ἀρχιμήδην, ῥύμην ἔχοντας ὑπερπετεῖς ποιήσεσθαι τὰς τῶν βελῶν ἀφέσεις, ἐγγύθεν δὲ καὶ τελέως ἀπράκτους εἶναι διάστημα τῆς πληγῆς οὐκ ἐχούσης. ὁ δ' ἦν, ὡς ἔοικεν, ἐπὶ ταῦτα πάλαι παρεσκευασμένος ὀργάνων τε συμμέτρους πρὸς πᾶν διάστημα κινήσεις καὶ βέλη βραχέα, καὶ διὰ <τὸ τεῖχος²> οὐ μεγάλων, πολλῶν

ARCHIMEDES

plunged down on their sterns, or were twisted round and turned about by means of ropes within the city, and dashed against the cliffs set by Nature under the wall and against the rocks, with great destruction of the crews, who were crushed to pieces. Often there was the fearful sight of a ship lifted out of the sea into mid-air and whirled about as it hung there, until the men had been thrown out and shot in all directions, when it would fall empty upon the walls or slip from the grip that had held it. As for the engine which Marcellus was bringing up from the platform of ships, and which was called *sambuca* from some resemblance in its shape to the musical instrument,^a while it was still some distance away as it was being carried to the wall a stone ten talents in weight was discharged at it, and after this a second and a third; some of these, falling upon it with a great crash and sending up a wave, crushed the base of the engine, shook the framework and dislodged it from the barrier, so that Marcellus in perplexity sailed away in his ships and passed the word to his land forces to retire.

In a council of war it was decided to approach the walls, if they could, while it was still night; for they thought that the ropes used by Archimedes, since they gave a powerful impetus, would send the missiles over their heads and would fail in their object at close quarters since there was no space for the cast. But Archimedes, it seems, had long ago prepared for such a contingency engines adapted to all distances and missiles of short range, and through openings in the

^a The *σαμβύκη* was a triangular musical instrument with four strings. Polybius (viii. 6) states that Marcellus had eight quinqueremes in pairs locked together, and on each pair a "sambuca" had been erected; it served as a penthouse for raising soldiers on to the battlements.

δὲ καὶ συνεχίων τρημάτων (ὄντων¹), οἱ σκορπίοι βραχύτονοι μὲν, ἐγγύθεν δὲ πληῆσαι παρεστήκεσαν ἀόρατοι τοῖς πολεμίοις.

Ὡς οὖν προσέμιξαν οἰόμενοι λανθάνειν, αὖθις αὖ βέλεσι πολλοῖς ἐντυγχάνοντες καὶ πληγαῖς, πετρῶν μὲν ἐκ κεφαλῆς ἐπ' αὐτοὺς φερομένων ὥσπερ πρὸς κάθετον, τοῦ δὲ τείχους τοξεύματα πανταχόθεν ἀναπέμποντος, ἀνεχώρουν ὀπίσω. κἀνταῦθα πάλιν αὐτῶν εἰς μῆκος ἐκτεταγμένων, βελῶν ἐκθεόντων καὶ καταλαμβανόντων ἀπιόντας ἐγένετο πολὺς μὲν αὐτῶν φθόρος, πολὺς δὲ τῶν νεῶν συγκρουσμός, οὐδὲν ἀντιδρᾶσαι τοὺς πολεμίους δυναμένων. τὰ γὰρ πλείστα τῶν ὀργάνων ὑπὸ τὸ τεῖχος ἐσκευοποίητο τῷ Ἀρχιμήδει, καὶ θεομαχοῦσιν ἐώκεσαν οἱ Ῥωμαῖοι, μυρίων αὐτοῖς κακῶν ἐξ ἀφανοῦς ἐπιχειρομένων.

Οὐ μὴν ἄλλ' ὁ Μάρκελλος ἀπέφυγέ τε καὶ τοὺς σὺν ἑαυτῷ σκώπτων τεχνίτας καὶ μηχανοποιούς ἔλεγεν· "οὐ παυσόμεθα πρὸς τὸν γεωμετρικὸν τοῦτον Βριάρεων πολεμοῦντες, ὅς ταῖς μὲν ναυσὶν^α ἡμῶν κυαθίζει ἐκ τῆς θαλάσσης, τὴν δὲ σαμβύκην ῥαπίζων^β μετ' αἰσχύνης ἐκβέβληκε, τοὺς δὲ μυθικοὺς ἐκατόγχειρας ὑπεραῖρει τοσαῦτα βάλλων ἅμα βέλη καθ' ἡμῶν;" τῷ γὰρ ὄντι πάντες οἱ λοιποὶ Συρακούσιοι σῶμα τῆς Ἀρχιμήδους παρασκευῆς ἦσαν, ἡ δὲ κινουσα πάντα καὶ στρέφουσα, ψυχὴ μία, τῶν μὲν ἄλλων ὅπλων ἀτρέμα κειμένων, μόνοις δὲ τοῖς ἐκείνου τότε τῆς πόλεως χρωμένης καὶ πρὸς ἄμυναν καὶ πρὸς ἀσφάλειαν. τέλος δὲ τοὺς Ῥωμαίους οὕτω περιφόβους γεγονότας ὁρῶν ὁ Μάρκελλος ὥστ', εἰ καλῶδιον ἢ ξύλον ὑπὲρ τοῦ

¹ ὄντων add. Sintenis ex Polyb.

ARCHIMEDES

wall, small in size but many and continuous, short-ranged engines called scorpions could be trained on objects close at hand without being seen by the enemy.

When, therefore, the Romans approached the walls, thinking to escape notice, once again they were met by the impact of many missiles; stones fell down on them almost perpendicularly, the wall shot out arrows at them from all points, and they withdrew to the rear. Here again, when they were drawn up some distance away, missiles flew forth and caught them as they were retiring, and caused much destruction among them; many of the ships, also, were dashed together and they could not retaliate upon the enemy. For Archimedes had made the greater part of his engines under the wall, and the Romans seemed to be fighting against the gods, inasmuch as countless evils were poured upon them from an unseen source.

Nevertheless Marcellus escaped, and, twitting his artificers and craftsmen, he said: "Shall we not cease fighting against this geometrical Briareus, who uses our ships like cups to ladle water from the sea, who has whipped our *sambuca* and driven it off in disgrace, and who outdoes all the hundred-handed monsters of fable in hurling so many missiles against us all at once?" For in reality all the other Syracusans were only a body for Archimedes' apparatus, and his the one soul moving and turning everything: all other weapons lay idle, and the city then used him alone, both for offence and for defence. In the end the Romans became so filled with fear that, if they saw a little piece of rope or of wood projecting over

ARCHIMEDES

the wall, they cried, "There it is, Archimedes is training some engine upon us," and fled; seeing this Marcellus abandoned all fighting and assault, and for the future relied on a long siege.

Yet Archimedes possessed so lofty a spirit, so profound a soul, and such a wealth of scientific inquiry, that although he had acquired through his inventions a name and reputation for divine rather than human intelligence, he would not deign to leave behind a single writing on such subjects. Regarding the business of mechanics and every utilitarian art as ignoble and vulgar, he gave his zealous devotion only to those subjects whose elegance and subtlety are untrammelled by the necessities of life; these subjects, he held, cannot be compared with any others; in them the subject-matter vies with the demonstration, the former possessing strength and beauty, the latter precision and surpassing power; for it is not possible to find in geometry more difficult and weighty questions, treated in simpler and purer terms. Some attribute this to the natural endowments of the man, others think it was the result of exceeding labour that everything done by him appeared to have been done without labour and with ease. For although by his own efforts no one could discover the proof, yet as soon as he learns it, he takes credit that he could have discovered it: so smooth and rapid is the path by which he leads to the conclusion. For these reasons there is no need to disbelieve the stories told about him—how, continually bewitched by some familiar siren dwelling with him, he forgot his food and neglected the care of his body; and how, when he was dragged by main force, as often happened, to the

ARCHIMEDES

place for bathing and anointing, he would draw geometrical figures in the hearths, and draw lines with his finger in the oil with which his body was anointed, being overcome by great pleasure and in truth inspired of the Muses. And though he made many elegant discoveries, he is said to have besought his friends and kinsmen to place on his grave after his death a cylinder enclosing a sphere, with an inscription giving the proportion by which the including solid exceeds the included.^a

Ibid. xix. 4-6

But what specially grieved Marcellus was the death of Archimedes. For it chanced that he was alone, examining a diagram closely; and having fixed both his mind and his eyes on the object of his inquiry, he perceived neither the inroad of the Romans nor the taking of the city. Suddenly a soldier came up to him and bade him follow to Marcellus, but he would not go until he had finished the problem and worked it out to the demonstration. Thereupon the soldier became enraged, drew his sword and dispatched him. Others, however, say that the Roman came upon him with drawn sword intending to kill him at once, and that Archimedes, on seeing him, besought and entreated him to wait a little while so that he might not leave the question unfinished and only partly investigated; but the soldier did not understand and slew him. There is also a third story, that as he was carrying to Marcellus some of his mathematical instruments, such as sundials, spheres and

grown with vegetation, but still bearing the cylinder with the sphere, and he restored it (*Tusc. Disp.* v. 64-66). The theorem proving the proportion is given *infra*, pp. 124-127.

τὸ τοῦ ἡλίου μέγεθος πρὸς τὴν οἶμιν, στρατιῶται περιτυχόντες καὶ χρυσιὸν ἐν τῷ τεύχει δόξαιτες φέρειν ἀπέκτειναν. ὅτι μέντοι Μάρκελλος ἤλγησε καὶ τὸν αὐτόχειρα τοῦ ἀνδρὸς ἀπεστράφη καθάπερ ἐναγῇ, τοὺς δὲ οἰκείους ἀνευρὼν ἐτίμησεν, ὁμολογεῖται.

^a Diodorus is writing of the island in the delta of the Nile.

^b It may be inferred that he studied with the successors of Euclid at Alexandria, and it was there perhaps that he made the acquaintance of Conon of Samos, to whom, as

ARCHIMEDIS

angles adjusted to the apparent size of the sun, some soldiers fell in with him and, under the impression that he carried treasure in the box, killed him. What is, however, agreed is that Marcellus was distressed, and turned away from the slayer as from a polluted person, and sought out the relatives of Archimedes to do them honour.

Pappus, *Collection* viii. 11. 19, ed. Hultsch 1960. 1-4 *

To the same type of inquiry belongs the problem : *To move a given weight by a given force.* This is one of Archimedes' discoveries in mechanics, whereupon he is said to have exclaimed : " Give me somewhere to stand and I will move the earth."

Diodorus Siculus i. 34. 2 .

As it is made of silt watered by the river after being deposited, it^a bears an abundance of fruits of all kinds ; for in the annual rising the river continually pours over it fresh alluvium, and men easily irrigate the whole of it by means of a certain instrument conceived by Archimedes of Syracuse, and which gets its name because it has the form of a spiral or *screw*.

Ibid. v. 37. 3

Most remarkable of all, they draw off streams of water by the so-called Egyptian screws, which Archimedes of Syracuse invented when he went by ship to Egypt.^b

the preface to his books *On the Sphere and Cylinder* shows, he used to communicate his discoveries before publication, and Eratosthenes of Cyrene, to whom he sent the *Method* and probably the *Cattle Problem*.

GREEK MATHEMATICS

Vitr. *De Arch.* ix., Praef. 9-12

Archimedis vero cum multa miranda inventa et varia fuerint, ex omnibus etiam infinita sollertia id quod exponam videtur esse expressum. Nimum Hiero Syracusis auctus regia potestate, rebus bene gestis cum auream coronam votivam diis immortalibus in quodam fano constituisset ponendam, manupretio locavit faciendam et aurum ad sacoma adpendit redemptori. Is ad tempus opus manu factum subtiliter regi adprobavit et ad sacoma pondus coronae visus est praestitisse. Posteaquam indicium est factum dempto auro tantundem argenti in id coronarium opus admixtum esse, indignatus Hiero se contemptum esse neque inveniens qua ratione id furtum deprehenderet, rogavit Archimeden uti insumeret sibi de eo cogitationem. Tunc is cum haberet eius rei curam, casu venit in balineum ibique cum in solium descenderet, animadvertit quantum corporis sui in eo insideret tantum aquae extra solium effluere. Idque cum eius rei rationem explicationis ostendisset, non est moratus sed exsiluit gaudio motus de solio et nudus vadens domum versus significabat clara voce invenisse quod quaereret. Nam currens identidem graece clamabat εὑρηκα εὑρηκα.

Tum vero ex eo inventionis ingressu duas fecisse dicitur massas acquo pondere quo etiam fuerat corona, unam ex auro et alteram ex argento. Cum ita fecisset, vas amplum ad summa labra implevit

* "I have found, I have found."

ARCHIMEDES

Vitruvius, *On Architecture* ix., Preface 9-1

Archimedes made many wonderful discoveries of different kinds, but of all these that which I shall now explain seems to exhibit a boundless ingenuity. When Hiero was greatly exalted in the royal power at Syracuse, in return for the success of his policy he determined to set up in a certain shrine a golden crown as a votive offering to the immortal gods. He let out the work for a stipulated payment, and weighed out the exact amount of gold for the contractor. At the appointed time the contractor brought his work skilfully executed for the king's approval, and he seemed to have fulfilled exactly the requirement about the weight of the crown. Later information was given that gold had been removed and an equal weight of silver added in the making of the crown. Hiero was indignant at this disrespect for himself, and, being unable to discover any means by which he might unmask the fraud, he asked Archimedes to give it his attention. While Archimedes was turning the problem over, he chanced to come to the place of bathing, and there, as he was sitting down in the tub, he noticed that the amount of water which flowed over the tub was equal to the amount by which his body was immersed. This indicated to him a means of solving the problem, and he did not delay, but in his joy leapt out of the tub and, rushing naked towards his home, he cried out with a loud voice that he had found what he sought. For as he ran he repeatedly shouted in Greek, *heureka, heureka*.^a

Then, following up his discovery, he is said to have made two masses of the same weight as the crown, the one of gold and the other of silver. When he had so done, he filled a large vessel right up to the brim

GREEK MATHEMATICS

aqua, in quo demisit argenteam massam. Cuius quanta magnitudo in vase depressa est, tantum aquae effluxit. Ita exempta massa quanto minus factum fuerat refudit sextario mensus, ut eodem modo quo prius fuerat ad labra aequaretur. Ita ex eo invenit quantum pondus argenti ad certam aquae mensuram responderet.

Cum id expertus esset, tum auream massam similiter pleno vase demisit et ea exempta eadem ratione mensura addita invenit deesse aquae non tantum sed minus, quanto minus magno corpore eodem pondere auri massa esset quam argenti. Postea vero repleto vase in eadem aqua ipsa corona demissa invenit plus aquae defluxisse in coronam quam in auream eodem pondere massam, et ita ex eo quod defuerit plus aquae in corona quam in massa, ratiocinatus apprehendit argenti in auro mixtionem et manifestum furtum redemptoris.

* The method may be thus expressed analytically.

Let w be the weight of the crown, and let it be made up of a weight w_1 of gold and a weight w_2 of silver, so that $w = w_1 + w_2$.

Let the crown displace a volume v of water.

Let the weight w of gold displace a volume v_1 of water; then a weight w_1 of gold displaces a volume $\frac{w_1}{w} \cdot v_1$ of water.

Let the weight w of silver displace a volume v_2 of water;

ARCHIMEDES

with water, into which he dropped the silver mass. The amount by which it was immersed in the vessel was the amount of water which overflowed. Taking out the mass, he poured back the amount by which the water had been depleted, measuring it with a pint pot, so that as before the water was made level with the brim. In this way he found what weight of silver answered to a certain measure of water.

When he had made this test, in like manner he dropped the golden mass into the full vessel. Taking it out again, for the same reason he added a measured quantity of water, and found that the deficiency of water was not the same, but less; and the amount by which it was less corresponded with the excess of a mass of silver, having the same weight, over a mass of gold. After filling the vessel again, he then dropped the crown itself into the water, and found that more water overflowed in the case of the crown than in the case of the golden mass of identical weight; and so, from the fact that more water was needed to make up the deficiency in the case of the crown than in the case of the mass, he calculated and detected the mixture of silver with the gold and the contractor's fraud stood revealed.^a

then a weight w_2 of silver displaces a volume $\frac{w_2}{w} \cdot v_2$ of water.

$$\begin{aligned} \text{It follows that } v &= \frac{w_1}{w} \cdot v_1 + \frac{w_2}{w} \cdot v_2 \\ &= \frac{w_1 v_1 + w_2 v_2}{w_1 + w_2}, \end{aligned}$$

so that
$$\frac{w_1}{w_2} = \frac{v_2 - v}{v - v_1}.$$

For an alternative method of solving the problem, *v. infra*, pp. 248-251.

φέρειαν τοῦ κύκλου, ὅς ἐστι βᾶσις τοῦ τμήματος·

¹ ἀξίων λόγου cod., ἀνελέγκτων conl. Heath.

^a The chief results of this book are described in the pre-
fatory letter to Dositheus. In this selection as much as
possible is given of what is essential to finding the proportions
between the surface and volume of the sphere and the surface
and volume of the enclosing cylinder, which Archimedes
regarded as his crowning achievement (*supra*, p. 32). In
the case of the surface, the whole series of propositions is
reproduced so that the reader may follow in detail the majestic
chain of reasoning by which Archimedes, starting from
seemingly remote premises, reaches the desired conclusion;
in the case of the volume only the final proposition (34) can
be given, for reasons of space, but the reader will be able to
prove the omitted theorems for himself. *Pari passu* with

ARCHIMEDES

(b) SURFACE AND VOLUME OF THE CYLINDER AND SPHERE

Archimedes. *On the Sphere and Cylinder* i., Archim. ed. Heiberg i. 2-132. 3^a

Archimedes to Dositheus greeting

On a previous occasion I sent you, together with the proof, so much of my investigations as I had set down in writing, namely, that *any segment bounded by a straight line and a section of a right-angled cone is four-thirds of the triangle having the same base as the segment and equal height.*^b Subsequently certain theorems deserving notice occurred to me, and I have worked out the proofs. They are these: first, that *the surface of any sphere is four times the greatest of the circles in it*^c; then, that *the surface of any segment of a sphere is equal to a circle whose radius is equal to the straight line drawn from the vertex of the segment to the circumference of the circle which is the base of the segment*^d; and,

this demonstration, Archimedes finds the surface and volume of any segment of a sphere. The method in each case is to inscribe in the sphere or segment of a sphere, and to circumscribe about it, figures composed of cones and frusta of cones. The sphere or segment of a sphere is intermediate in surface and volume between the inscribed and circumscribed figures, and in the limit, when the number of sides in the inscribed and circumscribed figures is indefinitely increased, it would become identical with them. It will readily be appreciated that Archimedes' method is fundamentally the same as integration, and on p. 116 n. b this will be shown trigonometrically.

^b This is proved in Props. 17 and 24 of the *Quadrature of the Parabola*, sent to Dositheus of Pelusium with a prefatory letter, v. pp. 228-243, *infra*.

^c *De Sphaera et Cyl.* i. 30. "The greatest of the circles," here and elsewhere, is equivalent to "a great circle."

^d *Ibid.* i. 42, 43.

πρὸς δὲ τούτοις, ὅτι πάσης σφαίρας ὁ κύλινδρος ὁ βάσιν μὲν ἔχων ἴσην τῷ μεγίστῳ κύκλῳ τῶν ἐν τῇ σφαίρᾳ, ὕψος δὲ ἴσον τῇ διαμέτρῳ τῆς σφαίρις αὐτός τε ἡμιόλιός ἐστιν τῆς σφαίρας, καὶ ἡ ἐπιφάνεια αὐτοῦ τῆς ἐπιφανείας τῆς σφαίρας. ταῦτα δὲ τὰ συμπτώματα τῇ φύσει προσηύρχεν περὶ τὰ εἰρημένα σχήματα, ἡγνοεῖτο δὲ ὑπὸ τῶν πρὸ ἡμῶν περὶ γεωμετρίαν ἀνεστραμμένων οὐδενὸς αὐτῶν ἐπινενοηκός, ὅτι τούτων τῶν σχημάτων ἐστὶν συμμετρία. . . . ἔξεσται δὲ περὶ τούτων ἐπισκέψασθαι τοῖς δυνατομένοις. ὤφειλε μὲν οὖν Κόνωνος ἔτι ζῶντος ἐκδίδοσθαι ταῦτα· τήνον γὰρ ὑπολαμβάνομεν που μάλιστα ἂν δύνασθαι κατανοῆσαι ταῦτα καὶ τὴν ἀρμόζουσαν ὑπὲρ αὐτῶν ἀπόφασιν ποιήσασθαι· δοκιμάζοντες δὲ καλῶς ἔχειν μεταδιδόναι τοῖς οἰκείοις τῶν μαθημάτων ἀποστέλλομέν σοι τὰς ἀποδείξεις ἀναγράψαντες, ὑπὲρ ὧν ἔξεσται τοῖς περὶ τὰ μαθήματα ἀναστρεφόμενοις ἐπισκέψασθαι. ἐρρωμένως.

Γράφονται πρῶτον τά τε ἀξιώματα καὶ τὰ λαμβανόμενα εἰς τὰς ἀποδείξεις αὐτῶν.

Ἄξιώματα

α'. Εἰσὶ τινες ἐν ἐπιπέδῳ καμπύλαι γραμμαι πεπερασμέναι, αἱ τῶν τὰ πέρατα ἐπιξευγνυσσῶν αὐτῶν εὐθειῶν ἥτοι ὅλαι ἐπὶ τὰ αὐτὰ εἰσιν ἢ οὐδὲν ἔχουσιν ἐπὶ τὰ ἕτερα.

β'. Ἐπὶ τὰ αὐτὰ δὴ κοίλην καλῶ τὴν τοιαύτην γραμμὴν, ἐν ᾗ ἐὰν δύο σημείων λαμβανομένων

^a *De Sphaera et Cyl.* i. 34 coroll. The surface of the cylinder here includes the bases.

ARCHIMEDES

further, that, in the case of any sphere, the cylinder having its base equal to the greatest of the circles in the sphere, and height equal to the diameter of the sphere, is one-and-a-half times the sphere, and its surface is one-and-a-half times the surface of the sphere.^a Now these properties were inherent in the nature of the figures mentioned, but they were unknown to all who studied geometry before me, nor did any of them suspect such a relationship in these figures.^b . . . But now it will be possible for those who have the capacity to examine these discoveries of mine. They ought to have been published while Conon was still alive, for I opine that he more than others would have been able to grasp them and pronounce a fitting verdict upon them; but, holding it well to communicate them to students of mathematics, I send you the proofs that I have written out, which proofs will now be open to those who are conversant with mathematics. Farewell.

In the first place, the axioms and the assumptions used for the proofs of these theorems are here set out.

AXIOMS ^c

1. There are in a plane certain finite bent lines which either lie wholly on the same side of the straight lines joining their extremities or have no part on the other side.

2. I call *concave in the same direction* a line such that, if any two points whatsoever are taken on it, either

^b In the omitted passage which follows, Archimedes compares his discovery with that of Eudoxus; it has already been given, vol. i. pp. 108-111.

^c These so-called axioms are more in the nature of definitions.

GREEK MATHEMATICS

ὁποιωνοῦν αἱ μεταξὺ τῶν σημείων εὐθεῖαι ἦτοι πᾶσαι ἐπὶ τὰ αὐτὰ πίπτουσιν τῆς γραμμῆς, ἢ τινὲς μὲν ἐπὶ τὰ αὐτά, τινὲς δὲ κατ' αὐτῆς, ἐπὶ τὰ ἕτερα δὲ μηδεμία.

γ'. Ὀμοίως δὴ καὶ ἐπιφάνειαι τινὲς εἰσιν πεπερασμέναι, αὐταὶ μὲν οὐκ ἐν ἐπιπέδῳ, τὰ δὲ πέρατα ἔχουσαι ἐν ἐπιπέδῳ, αἱ τοῦ ἐπιπέδου, ἐν ᾧ τὰ πέρατα ἔχουσιν, ἦτοι ὅλαι ἐπὶ τὰ αὐτὰ ἔσονται ἢ οὐδὲν ἔχουσιν ἐπὶ τὰ ἕτερα.

δ'. Ἐπὶ τὰ αὐτὰ δὴ κοίλας καλῶ τὰς τοιαύτας ἐπιφανείας, ἐν αἷς ἂν δύο σημείων λαμβανομένων αἱ μεταξὺ τῶν σημείων εὐθεῖαι ἦτοι πᾶσαι ἐπὶ τὰ αὐτὰ πίπτουσιν τῆς ἐπιφανείας, ἢ τινὲς μὲν ἐπὶ τὰ αὐτά, τινὲς δὲ κατ' αὐτῆς, ἐπὶ τὰ ἕτερα δὲ μηδεμία.

ε'. Τομέα δὲ στερεὸν καλῶ, ἐπειδὰν σφαῖραν κῶνος τέμνη κορυφὴν ἔχων πρὸς τῷ κέντρῳ τῆς σφαίρας, τὸ ἐμπεριεχόμενον σχῆμα ὑπὸ τε τῆς ἐπιφανείας τοῦ κώνου καὶ τῆς ἐπιφανείας τῆς σφαίρας ἐντὸς τοῦ κώνου.

ς'. Ῥόμβον δὲ καλῶ στερεόν, ἐπειδὰν δύο κῶνοι τὴν αὐτὴν βάσιν ἔχοντες τὰς κορυφὰς ἔχωσιν ἐφ' ἑκάτερα τοῦ ἐπιπέδου τῆς βάσεως, ὅπως οἱ ἄξονες αὐτῶν ἐπ' εὐθείας ᾧσι κείμενοι, τὸ ἐξ ἀμφοῖν τοῖν κῶνων συγκείμενον στερεὸν σχῆμα.

Λαμβανόμενα

Λαμβάνω δὲ ταῦτα·

α'. Τῶν τὰ αὐτὰ πέρατα ἔχουσῶν γραμμῶν ἐλάχιστην εἶναι τὴν εὐθεῖαν.

ARCHIMEDES

all the straight lines joining the points fall on the same side of the line, or some fall on one and the same side while others fall along the line itself, but none fall on the other side.

3. Similarly also there are certain finite surfaces, not in a plane themselves but having their extremities in a plane, and such that they will either lie wholly on the same side of the plane containing their extremities or will have no part on the other side.

4. I call *concave in the same direction* surfaces such that, if any two points on them are taken, either the straight lines between the points all fall upon the same side of the surface, or some fall on one and the same side while others fall along the surface itself, but none falls on the other side.

5. When a cone cuts a sphere, and has its vertex at the centre of the sphere, I call the figure comprehended by the surface of the cone and the surface of the sphere within the cone a *solid sector*.

6. When two cones having the same base have their vertices on opposite sides of the plane of the base in such a way that their axes lie in a straight line, I call the solid figure formed by the two cones a *solid rhombus*.

POSTULATES

I make these postulates :

1. Of all lines which have the same extremities the straight line is the least.^a

^a Proclus (*in Eucl.*, ed. Friedlein 110. 10-14) saw in this statement a connexion with Euclid's definition of a straight line as lying evenly with the points on itself: ὁ δ' αὖ Ἀρχιμήδης τὴν εὐθείαν ὥριστο γράμμην ἐλαχίστην τῶν τὰ αὐτὰ πέρατα ἔχουσῶν. διότι γάρ, ὡς ὁ Ἰουκλείδης λόγος φησὶν, ἐξ ἴσου κείται τοῖς ἐφ' ἑαυτῆς σημείοις, διὰ τοῦτου ἐλαχίστη ἐστὶν τῶν τὰ αὐτὰ πέρατα ἔχουσῶν.

β'. Τῶν δὲ ἄλλων γραμμῶν, εἰς ἐν ἐπιπέδῳ οὖσαι τὰ αὐτὰ πέρατα ἔχουσιν, ἀνίσους εἶναι τὰς τοιαύτας, ἐπειδὴν ὥσιν ἀμφοτέραι ἐπὶ τὰ αὐτὰ κοῖλαι, καὶ ἥτοι ὅλη περιλαμβάνηται ἢ ἑτέρα αὐτῶν ὑπὸ τῆς ἑτέρας καὶ τῆς εὐθείας τῆς τὰ αὐτὰ πέρατα ἐχούσης αὐτῇ, ἢ τινὰ μὲν περιλαμβάνηται, τινὰ δὲ κοινὰ ἔχῃ, καὶ ἐλάσσονα εἶναι τὴν περιλαμβανομένην.

γ'. Ὁμοίως δὲ καὶ τῶν ἐπιφανειῶν τῶν τὰ αὐτὰ πέρατα ἐχουσῶν, εἰς ἐν ἐπιπέδῳ τὰ πέρατα ἔχουσιν, ἐλάσσονα εἶναι τὴν ἐπίπεδον.

δ'. Τῶν δὲ ἄλλων ἐπιφανειῶν καὶ τὰ αὐτὰ πέρατα ἐχουσῶν, εἰς ἐν ἐπιπέδῳ τὰ πέρατα ἦ, ἀνίσους εἶναι τὰς τοιαύτας, ἐπειδὴν ὥσιν ἀμφοτέραι ἐπὶ τὰ αὐτὰ κοῖλαι, καὶ ἥτοι ὅλη περιλαμβάνηται ὑπὸ τῆς ἑτέρας ἢ ἑτέρα ἐπιφάνεια καὶ τῆς ἐπιπέδου τῆς τὰ αὐτὰ πέρατα ἐχούσης αὐτῇ, ἢ τινὰ μὲν περιλαμβάνηται, τινὰ δὲ κοινὰ ἔχῃ, καὶ ἐλάσσονα εἶναι τὴν περιλαμβανομένην.

ε'. Ἔτι δὲ τῶν ἀνίσων γραμμῶν καὶ τῶν ἀνίσων ἐπιφανειῶν καὶ τῶν ἀνίσων στερεῶν τὸ μείζον τοῦ ἐλάσσονος ὑπερέχειν τοιούτῳ, ὃ συντιθέμενον αὐτὸ ἑαυτῷ δυνατόν ἐστιν ὑπερέχειν παντὸς τοῦ προτεθέντος τῶν πρὸς ἄλληλα λεγομένων.

Τούτων δὲ ὑποκειμένων, εἰς κύκλον πολύγωνον ἐγγραφῇ, φανερόν, ὅτι ἡ περίμετρος τοῦ ἐγγραφέντος πολυγώνου ἐλάσσων ἐστὶν τῆς τοῦ κύκλου περιφερείας· ἐκάστη γὰρ τῶν τοῦ πολυγώνου πλευρῶν ἐλάσσων ἐστὶ τῆς τοῦ κύκλου περιφερείας τῆς ὑπὸ τῆς αὐτῆς ἀποτεμνομένης.

^a This famous "Axiom of Archimedes" is, in fact, generally used by him in the alternative form in which it is proved

ARCHIMEDES

2. Of other lines lying in a plane and having the same extremities, [any two] such are unequal when both are concave in the same direction and one is either wholly included between the other and the straight line having the same extremities with it, or is partly included by and partly common with the other ; and the included line is the lesser.

3. Similarly, of surfaces which have the same extremities, if those extremities be in a plane, the plane is the least.

4. Of other surfaces having the same extremities, if the extremities be in a plane, [any two] such are unequal when both are concave in the same direction, and one surface is either wholly included between the other and the plane having the same extremities with it, or is partly included by and partly common with the other ; and the included surface is the lesser.

5. Further, of unequal lines and unequal surfaces and unequal solids, the greater exceeds the less by such a magnitude as, when added to itself, can be made to exceed any assigned magnitude among those comparable with one another.^a

With these premises, *if a polygon be inscribed in a circle, it is clear that the perimeter of the inscribed polygon is less than the circumference of the circle ; for each of the sides of the polygon is less than the arc of the circle cut off by it.*

in Euclid x. 1, for which v. vol. i. pp. 452-455. The axiom can be shown to be equivalent to Dedekind's principle, that a section of the rational points in which they are divided into two classes is made by a single point. Applied to straight lines, it is equivalent to saying that there is a complete correspondence between the aggregate of real numbers and the aggregate of points in a straight line ; v. E. W. Hobson, *The Theory of Functions of a Real Variable*, 2nd ed., vol. i. p. 55.

α'

Ἐὰν περὶ κύκλον πολύγωνον περιγραφῇ, ἡ τοῦ περιγραφέντος πολυγώνου περίμετρος μείζων ἐστὶν τῆς περιμέτρου τοῦ κύκλου.

Περὶ γὰρ κύκλον πολύγωνον περιγεγράφθω τὸ ὑποκείμενον. λέγω, ὅτι ἡ περίμετρος τοῦ πολυγώνου μείζων ἐστὶν τῆς περιμέτρου τοῦ κύκλου.

Ἐπεὶ γὰρ συναμφοτέρως ἡ ΒΑΛ μείζων ἐστὶ τῆς ΒΛ περιφερείας διὰ τὸ τὰ αὐτὰ πέρατα ἔχουσιν περιλαμβάνειν τὴν περιφέρειαν, ὁμοίως δὲ καὶ συναμφοτέρως μὲν ἡ ΔΓ, ΓΒ τῆς ΔΒ, συναμφοτέρως δὲ ἡ ΛΚ, ΚΘ τῆς ΛΘ, συναμφοτέρως δὲ ἡ ΖΗΘ τῆς ΖΘ, ἔτι δὲ συναμφοτέρως ἡ ΔΕ, ΕΖ τῆς ΔΖ, ὅλη ἄρα ἡ περίμετρος τοῦ πολυγώνου μείζων ἐστὶ τῆς περιφερείας τοῦ κύκλου.

* It is here indicated, as in Prop. 3, that Archimedes added a figure to his own demonstration.

ARCHIMEDES

Prop. 1

If a polygon be circumscribed about a circle, the perimeter of the circumscribed polygon is greater than the circumference of the circle.

For let the polygon be circumscribed about the circle as below.* I say that the perimeter of the polygon is greater than the circumference of the circle.

For since $BA + A\Lambda > \text{arc } B\Lambda$,

owing to the fact that they have the same extremities as the arc and include it, and similarly

$$\Delta\Gamma + \Gamma B > [\text{arc}] \Delta B,$$

$$\Lambda K + K\Theta > [\text{arc}] \Lambda\Theta,$$

$$ZH + H\Theta > [\text{arc}] Z\Theta,$$

and further $\Delta E + EZ > [\text{arc}] \Delta Z,$

therefore the whole perimeter of the polygon is greater than the circumference of the circle.

ARCHIMEDES

Prop. 2

Given two unequal magnitudes, it is possible to find two unequal straight lines such that the greater straight line has to the less a ratio less than the greater magnitude has to the less.

Let AB, Δ be two unequal magnitudes, and let AB be the greater. I say that it is possible to find two unequal straight lines satisfying the aforesaid requirement.

By the second proposition in the first book of Euclid let $B\Gamma$ be placed equal to Δ , and let ZH be any straight line; then ΓA , if added to itself, will exceed Δ . [Post. 5.] Let it be multiplied, therefore, and let the result be $A\Theta$, and as $A\Theta$ is to $A\Gamma$, so let ZH be to HE ; therefore

$$\Theta A : A\Gamma = ZH : HE \quad [\text{cf. Eucl. v. 15}]$$

and conversely, $EH : HZ = A\Gamma : A\Theta$.

[Eucl. v. 7, coroll.]

And since

$$A\Theta > \Delta \\ > \Gamma B,$$

therefore $\Gamma A : A\Theta < \Gamma A : \Gamma B$. [Eucl. v. 8]

But

$$\Gamma A : A\Theta = EH : HZ;$$

therefore

$$EH : HZ < \Gamma A : \Gamma B;$$

componendo,

$$EZ : ZH < AB : B\Gamma.^a$$

Now

$$B\Gamma = \Delta;$$

therefore

$$EZ : ZH < AB : \Delta.$$

^a This and related propositions are proved by Eutocius [Archim. ed. Heiberg iii. 16. 11-18. 22] and by Pappus, *Coll.* ed. Hultsch 684. 20 ff. It may be simply proved thus. If $a : b < c : d$, it is required to prove that $a + b : b < c + d : d$. Let e be taken so that $a : b : e : d$. Then $e : d < c : d$. Therefore $e < c$, and $e + d : d < c + d : d$. But $e : d : d = a + b : b$ (see hypothesis, componendo). Therefore $a + b : b < c + d : d$.

Accordingly there have been discovered two unequal straight lines fulfilling the aforesaid requirement.

Prop. 3

Given two unequal magnitudes and a circle, it is possible to inscribe a [regular] polygon in the circle and to circumscribe another, in such a manner that the side of the circumscribed polygon has to the side of the inscribed polygon a ratio less than that which the greater magnitude has to the less.

Let A, B be the two given magnitudes, and let the

given circle be that set out below. I say then that it is possible to do what is required.

For let there be found two straight lines Θ , $\text{K}\Lambda$, of which Θ is the greater, such that Θ has to $\text{K}\Lambda$ a ratio

¹ τούτέστιν . . . ἔλασσον verba subditiua esse suspicatur
Heiberg.

ἐλάσσονα λόγον ἔχειν ἢ τὸ μείζον μέγεθος πρὸς τὸ ἕλαττον, καὶ ἤχθω ἀπὸ τοῦ Λ τῇ $\Lambda\mathbf{K}$ πρὸς ὀρθὰς ἢ $\Lambda\mathbf{M}$, καὶ ἀπὸ τοῦ \mathbf{K} τῇ Θ ἴση κατήχθω ἢ \mathbf{KM} [δυνατὸν γὰρ τοῦτο],¹ καὶ ἤχθωσαν τοῦ κύκλου δύο διάμετροι πρὸς ὀρθὰς ἀλλήλαις αἱ $\Gamma\mathbf{E}$, $\Delta\mathbf{Z}$. τέμνοντες οὖν τὴν ὑπὸ τῶν $\Delta\mathbf{H}\Gamma$ γωνίαν δίχα καὶ τὴν ἡμίσειαν αὐτῆς δίχα καὶ αἰεὶ τοῦτο ποιοῦντες λείβομέν τινα γωνίαν ἐλάσσονα ἢ διπλασίαν τῆς ὑπὸ $\Lambda\mathbf{KM}$. λελείφθω καὶ ἔστω ἡ ὑπὸ $\mathbf{NH}\Gamma$, καὶ ἐπεξεύχθω ἡ $\mathbf{N}\Gamma$. ἡ ἄρα $\mathbf{N}\Gamma$ πολυγώνου ἐστὶ πλευρὰ ἰσοπλεύρου [ἐπεὶ περ ἡ ὑπὸ $\mathbf{NH}\Gamma$ γωνία μετρεῖ τὴν ὑπὸ $\Delta\mathbf{H}\Gamma$ ὀρθὴν οὖσαν, καὶ ἡ $\mathbf{N}\Gamma$ ἄρα περιφέρειαν μετρεῖ τὴν $\Gamma\Delta$ τέταρτον οὖσαν κύκλου· ὥστε καὶ τὸν κύκλον μετρεῖ. πολυγώνου ἄρα ἐστὶ πλευρὰ ἰσοπλεύρου· φανερόν γάρ ἐστι τοῦτο].² καὶ τετμήσθω ἡ ὑπὸ $\Gamma\mathbf{H}\mathbf{N}$ γωνία δίχα τῇ $\mathbf{H}\Xi$ εὐθείᾳ, καὶ ἀπὸ τοῦ Ξ ἐφαπτέσθω τοῦ κύκλου ἡ $\mathbf{O}\Xi\Pi$, καὶ ἐκβεβλήσθωσαν αἱ $\mathbf{H}\mathbf{N}\Pi$, $\mathbf{H}\Gamma\mathbf{O}$. ὥστε καὶ ἡ $\mathbf{I}\Gamma\mathbf{O}$ πολυγώνου ἐστὶ πλευρὰ τοῦ περιγραφομένου περὶ τὸν κύκλον καὶ ἰσοπλεύρου [φανερὸν, ὅτι καὶ ὁμοίου τῷ ἐγγραφομένῳ, οὗ πλευρὰ ἡ $\mathbf{N}\Gamma$].³ ἐπεὶ δὲ ἐλάσσων ἐστὶν ἡ διπλασία ἢ ὑπὸ $\mathbf{NH}\Gamma$ τῆς ὑπὸ $\Lambda\mathbf{KM}$, διπλασία δὲ τῆς ὑπὸ $\mathbf{TH}\Gamma$, ἐλάσσων ἄρα ἢ ὑπὸ $\mathbf{TH}\Gamma$ τῆς ὑπὸ $\Lambda\mathbf{KM}$. καὶ εἰσιν ὀρθαὶ αἱ πρὸς τοῖς Λ , \mathbf{T} · ἡ ἄρα \mathbf{MK} πρὸς \mathbf{AK} μείζονα λόγον ἔχει ἢ περ ἡ \mathbf{GH} πρὸς \mathbf{HT} . ἴση δὲ ἡ \mathbf{GH} τῇ $\mathbf{H}\Xi$. ὥστε ἡ $\mathbf{H}\Xi$ πρὸς \mathbf{HT} ἐλάσσονα λόγον ἔχει, τουτέστιν ἡ $\mathbf{ΠO}$ πρὸς $\mathbf{N}\Gamma$, ἢ περ ἡ \mathbf{MK} πρὸς \mathbf{KL} . ἔτι δὲ ἡ \mathbf{MK} πρὸς \mathbf{KL} ἐλάσσονα λόγον ἔχει ἢ περ τὸ \mathbf{A} πρὸς τὸ \mathbf{B} . καὶ ἐστὶν ἡ μὲν $\mathbf{ΠO}$ πλευρὰ

ARCHIMEDES

less than that which the greater magnitude has to the less [Prop. 2], and from Λ let ΛM be drawn at right angles to ΛK , and from K let KM be drawn equal to Θ , and let there be drawn two diameters of the circle, ΓE , ΔZ , at right angles one to another. If we bisect the angle $\Delta H \Gamma$ and then bisect the half and so on continually we shall leave a certain angle less than double the angle $\Delta K M$. Let it be left and let it be the angle $N H \Gamma$, and let $N \Gamma$ be joined; then $N \Gamma$ is the side of an equilateral polygon. Let the angle $\Gamma H N$ be bisected by the straight line $H E$, and through E let the tangent $O E \Pi$ be drawn, and let $H N \Pi$, $H \Gamma O$ be produced; then ΠO is a side of an equilateral polygon circumscribed about the circle. Since the angle $N H \Gamma$ is less than double the angle $\Delta K M$ and is double the angle $T H \Gamma$, therefore the angle $T H \Gamma$ is less than the angle $\Delta K M$. And the angles at Λ , T are right; therefore

$$MK : \Lambda K > \Gamma H : HT.^a$$

But $\Gamma H = H E$.

Therefore $H E : HT < MK : \Lambda K$,

that is, $\Pi O : N \Gamma < MK : \Lambda K.^b$

Further, $MK : \Lambda K < A : B.^c$

[Therefore $\Pi O : N \Gamma < A : B.$]

^a This is proved by Eutocius and is equivalent to the assertion that if $\alpha < \beta \leq \frac{\pi}{2}$, $\text{cosec } \beta > \text{cosec } \alpha$.

^b For $H E : HT = \Pi O : N \Gamma$, since $H E : HT = O E : \Gamma T = 2 O E : 2 \Gamma T = \Pi O : \Gamma N$.

^c For by hypothesis $\Theta : \Lambda K < A : B$, and $\Theta = MK$.

ARCHIMEDES

Firstly, let it be not less. Then since there are two surfaces, the surface of the cone between $A\Delta$, ΔB together with the segment AEB and the triangle $A\Delta B$, having the same extremity, that is, the perimeter of the triangle $A\Delta B$, the surface which includes the other is greater than the included surface [Post. 8]; therefore the surface of the cone between the straight lines $A\Delta$, ΔB together with the segment AEB is greater than the triangle $AB\Delta$. Similarly the [surface of the cone] between $B\Delta$, $\Delta\Gamma$ together with the segment ΓZB is greater than the triangle $B\Delta\Gamma$; therefore the whole surface of the cone together with the area Θ is greater than the aforesaid triangles. Now the aforesaid triangles are equal to the triangle $A\Delta\Gamma$ and the area Θ . Let the common area Θ be taken away; therefore the remainder, the surface of the cone between $A\Delta$, $\Delta\Gamma$ is greater than the triangle $A\Delta\Gamma$.

Now let Θ be less than the segments AB , $B\Gamma$. Bisecting the arcs AB , $B\Gamma$ and then bisecting their halves, we shall leave segments less than the area Θ [Eucl. xii. 2]. Let the segments so left be those on the straight lines AE , EB , BZ , $Z\Gamma$, and let ΔE , ΔZ be joined. Then once more by the same reasoning the surface of the cone between $A\Delta$, ΔE together with the segment AE is greater than the triangle $A\Delta E$, while that between $E\Delta$, ΔB together with the segment EB is greater than the triangle $E\Delta B$; therefore the surface between $A\Delta$, ΔB together with the segments AE , EB is greater than the triangles $A\Delta E$, $E\Delta B$. Now since the triangles $A\Delta E$, $\Delta E B$ are greater than the triangle $AB\Delta$, as was proved, by much more therefore the surface of the cone between $A\Delta$, ΔB together with the segments AE , EB is

ΕΒ τμημάτων μείζων ἐστὶ τοῦ ΑΔΒ τριγώνου. διὰ τὰ αὐτὰ δὴ καὶ ἡ ἐπιφάνεια ἡ μεταξὺ τῶν ΒΔΓ μετὰ τῶν ἐπὶ τῶν ΒΖ, ΖΓ τμημάτων μείζων ἐστὶν τοῦ ΒΔΓ τριγώνου· ὅλη ἄρα ἡ ἐπιφάνεια ἡ μεταξὺ τῶν ΑΔΓ μετὰ τῶν εἰρημένων τμημάτων μείζων ἐστὶ τῶν ΑΒΔ, ΔΒΓ τριγώνων. ταῦτα δέ ἐστιν ἴσα τῷ ΑΔΓ τριγώνῳ καὶ τῷ Θ χωρίου· ὧν τὰ εἰρημένα τμήματα ἐλάσσονα τοῦ Θ χωρίου· λοιπὴ ἄρα ἡ ἐπιφάνεια ἡ μεταξὺ τῶν ΑΔΓ μείζων ἐστὶν τοῦ ΑΔΓ τριγώνου.

greater than the triangle $\Lambda\Delta B$. By the same reasoning the surface between $B\Delta$, $\Delta\Gamma$ together with the segments BZ , $Z\Gamma$ is greater than the triangle $B\Delta\Gamma$; therefore the whole surface between $\Lambda\Delta$, $\Delta\Gamma$ together with the aforesaid segments is greater than the triangles $\Lambda B\Delta$, $\Delta B\Gamma$. Now these are equal to the triangle $\Lambda\Delta\Gamma$ and the area Θ ; and the aforesaid segments are less than the area Θ ; therefore the remainder, the surface between $\Lambda\Delta$, $\Delta\Gamma$ is greater than the triangle $\Lambda\Delta\Gamma$.

Prop. 10

If tangents be drawn to the circle which is the base of an [isosceles] cone, being in the same plane as the circle and meeting one another, and from the points of contact and the point of meeting straight lines be drawn to the vertex of the cone, the triangles formed by the tangents and the lines drawn to the vertex of the cone are together greater than the portion of the surface of the cone included by them. . . .^a

Prop. 12

. . . From what has been proved it is clear that, if a pyramid is inscribed in an isosceles cone, the surface of the pyramid without the base is less than the surface of the cone [Prop. 9], and that, if a pyramid

^a The proof is on lines similar to the preceding proposition.

βάσεως ἐλάσσων ἐστὶ τῆς ἐπιφανείας τοῦ κώνου χωρὶς τῆς βάσεως],¹ καὶ ὅτι, ἐὰν περὶ κῶνον ἰσοσκελῇ πυραμὶς περιγραφῇ, ἡ ἐπιφάνεια τῆς πυραμίδος χωρὶς τῆς βάσεως μείζων ἐστὶν τῆς ἐπιφανείας τοῦ κώνου χωρὶς τῆς βάσεως [κατὰ τὸ συνεχὲς ἐκείνῳ].²

Φανερόν δὲ ἐκ τῶν ἀποδεδειγμένων, ὅτι τε, ἐὰν εἷς κύλινδρον ὀρθὸν πρίσμα ἐγγραφῇ, ἡ ἐπιφάνεια τοῦ πρίσματος ἢ ἐκ τῶν παραλληλογράμμων συγκειμένη ἐλάσσων ἐστὶ τῆς ἐπιφανείας τοῦ κυλίνδρου χωρὶς τῆς βάσεως [ἐλάσσον γὰρ ἕκαστον παραλληλόγραμμον τοῦ πρίσματός ἐστι τῆς καθ' αὐτὸ τοῦ κυλίνδρου ἐπιφανείας],³ καὶ ὅτι, ἐὰν περὶ κύλινδρον ὀρθὸν πρίσμα περιγραφῇ, ἡ ἐπιφάνεια τοῦ πρίσματος ἢ ἐκ τῶν παραλληλογράμμων συγκειμένη μείζων ἐστὶ τῆς ἐπιφανείας τοῦ κυλίνδρου χωρὶς τῆς βάσεως.

ARCHIMEDES

is circumscribed about an isosceles cone, the surface of the pyramid without the base is greater than the surface of the cone without the base [Prop. 10].

From what has been demonstrated it is also clear that, if a right prism be inscribed in a cylinder, the surface of the prism composed of the parallelograms is less than the surface of the cylinder excluding the bases ^a [Prop. 11], and if a right prism be circumscribed about a cylinder, the surface of the prism composed of the parallelograms is greater than the surface of the cylinder excluding the bases.

Prop. 13

The surface of any right cylinder excluding the bases ^b is equal to a circle whose radius is a mean proportional between the side of the cylinder and the diameter of the base of the cylinder.

Let the circle A be the base of a right cylinder, let $\Gamma\Delta$ be equal to the diameter of the circle A, let EZ be equal to the side of the cylinder, let H be a mean proportional between $\Delta\Gamma$, EZ , and let there be set out a circle, B, whose radius is equal to H; it is required to prove that the circle B is equal to the surface of the cylinder excluding the bases.^b

For if it is not equal, it is either greater or less.

^a Here, and in other places in this and the next proposition, Archimedes must have written *χωρὶς τῶν βάσεων*, not *χωρὶς τῆς βάσεως*. •

^b See preceding note.

ARCHIMEDES

to the perimeter of the rectilineal figure about the circle A, let ΔZ be equal to $K\Delta$, and let ΓT be half of $\Gamma\Delta$; then the triangle $K\Delta T$ will be equal to the rectilineal figure circumscribed about the circle A,^a while the parallelogram $E\Delta$ will be equal to the surface of the prism circumscribed about the cylinder.^b Let EP be set out equal to EZ ; then the triangle ZPA is equal to the parallelogram $E\Delta$ [Eucl. i. 41], and so to the surface of the prism. And since the rectilineal figures circumscribed about the circles A, B are similar, they will stand in the same ratio as the squares on the radii^c; therefore the triangle $K\Delta T$ will have to the rectilineal figure circumscribed about the circle B the ratio $T\Delta^2 : H^2$.

But $T\Delta^2 : H^2 = T\Delta : PZ$.^d

^a Because the base $K\Delta$ is equal to the perimeter of the polygon, and the altitude ΔT is equal to the radius of the circle A, i.e., to the perpendiculars drawn from the centre of A to the sides of the polygon.

^b Because the base ΔZ is made equal to ΔK and so is equal to the perimeter of the polygon forming the base of the prism, while the altitude EZ is equal to the side of the cylinder and therefore to the height of the prism.

^c Eutocius supplies a proof based on Eucl. xii. 1, which proves a similar theorem for inscribed figures.

^d For, by hypothesis, $H^2 = \Delta T \cdot PZ$
 $= 2T\Delta \cdot \frac{1}{2}PZ$
 $= T\Delta \cdot PZ$

Heiberg would delete the demonstration in the text on the ground of excessive verbosity, as Nizze had already perceived to be necessary.

ὥς ἡ $\Gamma\Delta$ πρὸς H , οὕτως ἡ Π πρὸς ΓZ . ἔστιν ἄρα, ὥς ἡ $\Gamma\Delta$ πρὸς ΓZ , τὸ ἀπὸ τῆς $\Gamma\Delta$ πρὸς τὸ ἀπὸ τῆς H . ἐὰν γὰρ τρεῖς εὐθεῖαι ἀνάλογον ᾧσιν, ἔστιν, ὥς ἡ πρώτη πρὸς τὴν τρίτην, τὸ ἀπὸ τῆς πρώτης εἶδος πρὸς τὸ ἀπὸ τῆς δευτέρας εἶδος τὸ ὁμοιον καὶ ὁμοίως ἀναγεγραμμένον]¹. ὃν δὲ λόγον ἔχει ἡ $\Gamma\Delta$ πρὸς ΓZ μήκει, τοῦτον ἔχει τὸ ΚΤΔ τρίγωνον πρὸς τὸ ΡΛΖ [ἐπειδήπερ ἴσαι εἰσὶν αἱ ΚΔ , ΛΖ]². τὸν αὐτὸν ἄρα λόγον ἔχει τὸ ΚΤΔ τρίγωνον πρὸς τὸ εὐθύγραμμον τὸ περὶ τὸν B κύκλον περιγεγραμμένον, ὅνπερ τὸ ΤΚΔ τρίγωνον πρὸς τὸ ΓΖΛ τρίγωνον. ἴσον ἄρα ἐστὶν τὸ ΖΛΠ τρίγωνον τῷ περὶ τὸν B κύκλον περιγεγραμμένῳ εὐθυγράμμῳ· ὥστε καὶ ἡ ἐπιφάνεια τοῦ πρίσματος τοῦ περὶ τὸν A κύλινδρον περιγεγραμμένου τῷ εὐθυγράμμῳ τῷ περὶ τὸν B κύκλον ἴση ἐστίν. καὶ ἐπεὶ ἐλάσσονα λόγον ἔχει τὸ εὐθύγραμμον τὸ περὶ τὸν B κύκλον πρὸς τὸ ἐγγεγραμμένον ἐν τῷ κύκλῳ τοῦ, ὃν ἔχει ἡ ἐπιφάνεια τοῦ A κυλίνδρου πρὸς τὸν B κύκλον, ἐλάσσονα λόγον ἔξει καὶ ἡ ἐπιφάνεια τοῦ πρίσματος τοῦ περὶ τὸν κύλινδρον περιγεγραμμένου πρὸς τὸ εὐθύγραμμον τὸ ἐν τῷ κύκλῳ τῷ B ἐγγεγραμμένον ἢ περὶ ἡ ἐπιφάνεια τοῦ κυλίνδρου πρὸς τὸν B κύκλον· καὶ ἐναλλάξ· ὅπερ ἀδύνατον [ἡ μὲν γὰρ ἐπιφάνεια τοῦ πρίσματος τοῦ περιγεγραμμένου περὶ τὸν κύλινδρον μείζων οὖσα δέδεικται τῆς ἐπιφανείας τοῦ κυλίνδρου, τὸ δὲ ἐγγεγραμμένον εὐθύγραμμον ἐν τῷ B κύκλῳ ἐλασσὸν ἐστὶν τοῦ B κύκλου].³ οὐκ ἄρα ἐστὶν ὁ B κύκλος ἐλάσσων τῆς ἐπιφανείας τοῦ κυλίνδρου.

ARCHIMEDES

And $TA : PZ = \text{triangle } KTA : \text{triangle } PAZ$.^a

Therefore the ratio which the triangle KTA has to the rectilineal figure circumscribed about the circle B is the same as the ratio of the triangle TKA to the triangle PZA . Therefore the triangle TKA is equal to the rectilineal figure circumscribed about the circle B [Eucl. v. 9]; and so the surface of the prism circumscribed about the cylinder A is equal to the rectilineal figure about B . And since the rectilineal figure about the circle B has to the inscribed figure in the circle a ratio less than that which the surface of the cylinder A has to the circle B [*ex hypothesi*], the surface of the prism circumscribed about the cylinder will have to the rectilineal figure inscribed in the circle B a ratio less than that which the surface of the cylinder has to the circle B ; and, *permutando*, [the prism will have to the cylinder a ratio less than that which the rectilineal figure inscribed in the circle B has to the circle B]^b; which is absurd.^c Therefore the circle B is not less than the surface of the cylinder.

^a By Eucl. vi. 1, since $AZ = KA$. *

^b From Eutocius's comment it appears that Archimedes wrote, in place of *καὶ ἐναλλάξ ὅπερ ἀδύνατον* in our text: *ἐναλλάξ ἄρα ἐλάσσονα λόγον ἔχει τὸ πρίσμα πρὸς τὸν κύλινδρον ἢ πρὸς τὸ ἐγγεγραμμένον εἰς τὸν B κύκλον πολὺγωνον πρὸς τὸν B κύκλον ὅπερ ἄτοπον*. *This is what I translate.

^c For the surface of the prism is greater than the surface of the cylinder [Prop. 12], but the inscribed figure is less than the circle B ; the explanation in our text to this effect is shown to be an interpolation by the fact that Eutocius supplies a proof in his own words.

³ ἡ μὲν . . . τοῦ B κύκλου οἰν. Heiberg ex Eutocio.

Ἔστω δὴ, εἰ δυνατόν, μείζων. πάλιν δὴ νοείσθω εἰς τὸν Β κύκλον εὐθύγραμμον ἐγγεγραμμένον καὶ ἄλλο περιγεγραμμένον, ὥστε τὸ περιγεγραμμένον πρὸς τὸ ἐγγεγραμμένον ἐλάσσονα λόγον ἔχειν ἢ τὸν Β κύκλον πρὸς τὴν ἐπιφάνειαν τοῦ κυλίνδρου, καὶ ἐγγεγράθω εἰς τὸν Λ κύκλον πολυγώνον ὁμοιον τῷ εἰς τὸν Β κύκλον ἐγγεγραμμένῳ, καὶ πρίσμα ἀναγεγράθω ἀπὸ τοῦ ἐν τῷ κύκλῳ ἐγγεγραμμένου πολυγώνου· καὶ πάλιν ἡ ΚΔ ἴση ἔστω τῇ περιμέτρῳ τοῦ εὐθυγράμμου τοῦ ἐν τῷ Α κύκλῳ ἐγγεγραμμένου, καὶ ἡ ΖΛ ἴση αὐτῇ ἔστω. ἔσται δὴ τὸ μὲν ΚΤΔ τρίγωνον μείζον τοῦ εὐθυγράμμου τοῦ ἐν τῷ Α κύκλῳ ἐγγεγραμμένου [διότι βάσιν μὲν ἔχει τὴν περίμετρον αὐτοῦ, ὕψος δὲ μείζον τῆς ἀπὸ τοῦ κέντρου ἐπὶ μίαν πλευρὰν τοῦ πολυγώνου ἀγομένης καθέτου],¹ τὸ δὲ ΕΛ παραλληλόγραμμον ἴσον τῇ ἐπιφανείᾳ τοῦ πρίσματος τῇ ἐκ τῶν παραλληλογράμμων συγκεκμημένη [διότι περιέχεται ὑπὸ τῆς πλεύρας τοῦ κυλίνδρου καὶ τῆς ἴσης τῇ περιμέτρῳ τοῦ εὐθυγράμμου, ὃ ἔστιν βᾶσις τοῦ πρίσματος]· ὥστε καὶ τὸ ΡΛΖ τρίγωνον ἴσον ἐστὶ τῇ ἐπιφανείᾳ τοῦ πρίσματος. καὶ ἔπειδ ὁμοιά ἐστι τὰ εὐθύγραμμα τὰ ἐν τοῖς Α, Β κύκλοις ἐγγεγραμμένα, τὸν αὐτὸν ἔχει λόγον πρὸς ἄλληλα, ὃν αἱ ἐκ τῶν κέντρων αὐτῶν δυνάμει. ἔχει δὲ καὶ τὰ ΚΤΔ, ΖΡΛ τρίγωνα πρὸς ἄλληλα λόγον, ὃν αἱ ἐκ τῶν κέντρων τῶν κύκλων δυνάμει· τὸν αὐτὸν ἄρα λόγον ἔχει

¹ διότι . . . καθέτου om. Heiberg.

^a For the base ΚΔ is equal to the perimeter of the polygon and the altitude ΔΤ, which is equal to the radius of the

ARCHIMEDES

Now let it be, if possible, greater. Again, let there be imagined a rectilineal figure inscribed in the circle B, and another circumscribed, so that the circumscribed figure has to the inscribed a ratio less than that which the circle B has to the surface of the cylinder [Prop. 5], and let there be inscribed in the circle A a polygon similar to the figure inscribed in the circle B, and let a prism be erected on the polygon inscribed in the circle [A]; and again let $K\Delta$ be equal to the perimeter of the rectilineal figure inscribed in the circle A, and let ZA be equal to it. Then the triangle KTA will be greater than the rectilineal figure inscribed in the circle A,^a and the parallelogram EA will be equal to the surface of the prism composed of the parallelograms^b; and so the triangle PAZ is equal to the surface of the prism. And since the rectilineal figures inscribed in the circles A, B are similar, they have the same ratio one to the other as the squares of their radii [Eucl. xii. 1]. But the triangles KTA , ZPA have one to the other the same ratio as the squares of the radii^c; therefore the rectilineal figure inscribed in

circle A, is greater than the perpendiculars drawn from the centre of the circle to the sides of the polygon; but Heiberg regards the explanation to this effect in the text as an interpolation.

^b Because the base ZA is made equal to $K\Delta$, and so is equal to the perimeter of the polygon forming the base of the prism, while the altitude PA is equal to the side of the cylinder and hence to the length of the prism.

$$\begin{aligned} \text{c} \text{ The triangle } KTA : \text{triangle } ZPA &= TA : ZP \\ &= TA^2 : H^2 \end{aligned}$$

[cf. p. 71 n. d.]

But TA is equal to the radius of the circle A, and H to the radius of the circle B.

^ο For since the figure circumscribed about the circle Α has to the inscribed figure a ratio less than that which the circle Β has to the surface of the cylinder [*ce hypothesis*], and the circle Β is less than the circumscribed figure, therefore the

ARCHIMEDES

the circle A has to the rectilineal figure inscribed in the circle B the same ratio as the triangle $KT\Delta$ has to the triangle ΔZP . But the rectilineal figure inscribed in the circle A is less than the triangle $KT\Delta$; therefore the rectilineal figure inscribed in the circle B is less than the triangle ZPA ; and so it is less than the surface of the prism inscribed in the cylinder; which is impossible.^a Therefore the circle B is not greater than the surface of the cylinder. But it was proved not to be less. Therefore it is equal.

Prop. 14

The surface of any cone without the base is equal to a circle, whose radius is a mean proportional between the side of the cone and the radius of the circle which is the base of the cone.

Let there be an isosceles cone, whose base is the circle A, and let its radius be l' , and let Δ be equal inscribed figure is greater than the surface of the cylinder, and *a fortiori* is greater than the surface of the prism [Prop. 12]. An explanation on these lines is found in our text, but as the corresponding proof in the first half of the proposition was unknown to Eulocius, this also must be presumed an interpolation.

GREEK MATHEMATICS

κώνου ἔστω ἴση ἢ Δ, τῶν δὲ Γ, Δ μέση ἀνάλογον ἢ Ε, ὁ δὲ Β κύκλος ἐχέτω τὴν ἐκ τοῦ κέντρου τῇ Ε ἴσην· λέγω, ὅτι ὁ Β κύκλος ἐστὶν ἴσος τῇ ἐπιφανείᾳ τοῦ κώνου χωρὶς τῆς βάσεως.

 κύκλος ἐλάσσων ἐστὶ τῆς ἐπιφανείας τοῦ κώνου.

ARCHIMEDES

the circles A, B are similar, they have the same ratio one toward the other as the square of the radii have one toward the other, that is $\Gamma^2 : E^2$, or $\Gamma : \Delta$ [Eucl. vi. 20, coroll. 2]. But $\Gamma : \Delta$ is the same ratio as that of the polygon circumscribed about the circle A to the surface of the pyramid circumscribed about the cone ^a; therefore the rectilineal figure about the circle A has to the rectilineal figure about the circle B the same ratio as this rectilineal figure [about A] has to the surface of the pyramid circumscribed about the cone; therefore the surface of the pyramid is equal to the rectilineal figure circumscribed about the circle B. Since the rectilineal figure circumscribed about the circle B has towards the inscribed [rectilineal figure] a ratio less than that which the surface of the cone has to the circle B, therefore the surface of the pyramid circumscribed about the cone will have to the rectilineal figure inscribed in the circle B a ratio less than that which the surface of the cone has to the circle B; which is impossible.^b Therefore the circle B will not be less than the surface of the cone.

^a For the circumscribed polygon is equal to a triangle, whose base is equal to the perimeter of the polygon and whose height is equal to Γ , while the surface of the pyramid is equal to a triangle having the same base and height Δ [Prop. 8]. There is an explanation to this effect in the Greek, but so obscurely worded that Heiberg attributes it to an interpolator.

^b For the surface of the pyramid is greater than the surface of the cone [Prop. 12], while the inscribed polygon is less than the circle B.

¹ ἡ μὲν . . . ἐπιφανειῶν om. Heiberg.

² ἡ μὲν . . . τοῦ B κύκλου om. Heiberg.

Λέγω δὴ, ὅτι οὐδὲ μείζων. εἰ γὰρ δυνατόν
 ἔστιν, ἔστω μείζων. πάλιν δὴ νοείσθω εἰς τὸν Β
 κύκλον πολύγωνον ἐγγεγραμμένον καὶ ἄλλο περι-
 γεγραμμένον, ὥστε τὸ περιγεγραμμένον πρὸς τὸ
 ἐγγεγραμμένον ἐλάσσονα λόγον ἔχειν τοῦ, ὃν ἔχει

^a Eutocius supplies a proof. ZΘK is the polygon inscribed in the circle A (of centre A), AH is drawn perpendicular to
 82

ARCHIMÈDES

I say now that neither will it be greater. For if it is possible, let it be greater. Then again let there be imagined a polygon inscribed in the circle B and another circumscribed, so that the circumscribed has to the inscribed a ratio less than that which the circle B has to the surface of the cone [Prop. 5], and in the circle A let there be imagined an inscribed polygon similar to that inscribed in the circle B, and on it let there be drawn a pyramid having the same vertex as the cone. Since the polygons inscribed in the circles A, B are similar, therefore they will have one toward the other the same ratio as the squares of the radii have one toward the other; therefore the one polygon has to the other polygon the same ratio as Γ to Δ [Eucl. vi. 20, coroll. 2]. But Γ has to Δ a ratio greater than that which the polygon inscribed in the circle A has to the surface of the pyramid inscribed in the cone^a; therefore the polygon in-

KΘ and meets the circle in M, Δ is the vertex of the isosceles cone (so that ΔH is perpendicular to KΘ), and HN is drawn parallel to MA to meet ΔΔ in N. Then the area of the polygon inscribed in the circle = $\frac{1}{2}$ perimeter of polygon . ΔH, and the area of the pyramid inscribed in the cone = $\frac{1}{2}$ perimeter of polygon . ΔH, so that the area of the polygon has to the area of the pyramid the ratio ΔH : ΔH. Now, by similar triangles, AM : MA = ΔH : HN, and ΔH : HN > ΔH : HA, for HA > HN. Therefore AM : MA > ΔH : HA; that is, Γ' : Δ exceeds the ratio of the polygon to the surface of the pyramid.

ζονα ἄρα λόγον ἔχει τὸ πολύγωνον τὸ ἐν τῷ Α κύκλῳ ἐγγεγραμμένον πρὸς τὸ πολύγωνον τὸ ἐν τῷ Β ἐγγεγραμμένον ἢ αὐτὸ τὸ πολύγωνον πρὸς τὴν ἐπιφάνειαν τῆς πυραμίδος· μείζων ἄρα ἐστὶν ἢ ἐπιφάνεια τῆς πυραμίδος τοῦ ἐν τῷ Β πολυγώνου ἐγγεγραμμένου. ἐλάσσονα δὲ λόγον ἔχει τὸ πολύγωνον τὸ περὶ τὸν Β κύκλον περιγεγραμμένον πρὸς τὸ ἐγγεγραμμένον ἢ ὁ Β κύκλος πρὸς τὴν ἐπιφάνειαν τοῦ κώνου· πολλῶν ἄρα τὸ πολύγωνον τὸ περὶ τὸν Β κύκλον περιγεγραμμένον πρὸς τὴν ἐπιφάνειαν τῆς πυραμίδος τῆς ἐν τῷ κώνῳ ἐγγεγραμμένης ἐλάσσονα λόγον ἔχει ἢ ὁ Β κύκλος πρὸς τὴν ἐπιφάνειαν τοῦ κώνου· ὅπερ ἀδύνατον [τὸ μὲν γὰρ περιγεγραμμένον πολύγωνον μείζον ἐστὶν τοῦ Β κύκλου, ἢ δὲ ἐπιφάνεια τῆς πυραμίδος τῆς ἐν τῷ κώνῳ ἐλάσσων ἐστὶ τῆς ἐπιφανείας τοῦ κώνου].¹ οὐκ ἄρα οὐδὲ μείζων ἐστὶν ὁ κύκλος τῆς ἐπιφανείας τοῦ κώνου. ἐδείχθη δέ, ὅτι οὐδὲ ἐλάσσων ἴσος ἄρα.

ις'

Ἐὰν κῶνος ἰσοσκελὴς ἐπιπέδῳ τμηθῇ παραλλήλῳ τῇ βάσει, τῇ μεταξὺ τῶν παραλλήλων ἐπιπέδων ἐπιφάνεια τοῦ κώνου ἴσος ἐστὶ κύκλος, οὗ ἢ ἐκ τοῦ κέντρου μέσον λόγον ἔχει τῆς τε πλευρᾶς τοῦ κώνου τῆς μεταξὺ τῶν παραλλήλων ἐπιπέδων καὶ τῆς ἴσης ἀμφοτέραις ταῖς ἐκ τῶν κέντρων τῶν κύκλων τῶν ἐν τοῖς παραλλήλοις ἐπιπέδοις.

ARCHIMEDES

scribed in the circle A has to the polygon inscribed in the circle B a ratio greater than that which the same polygon [inscribed in the circle A] has to the surface of the pyramid ; therefore the surface of the pyramid is greater than the polygon inscribed in B. Now the polygon circumscribed about the circle B has to the inscribed polygon a ratio less than that which the circle B has to the surface of the cone ; by much more therefore the polygon circumscribed about the circle B has to the surface of the pyramid inscribed in the cone a ratio less than that which the circle B has to the surface of the cone ; which is impossible.* Therefore the circle is not greater than the surface of the cone. And it was proved not to be less ; therefore it is equal.

Prop. 16

If an isosceles cone be cut by a plane parallel to the base, the portion of the surface of the cone between the parallel planes is equal to a circle whose radius is a mean proportional between the portion of the side of the cone between the parallel planes and a straight line equal to the sum of the radii of the circles in the parallel planes.

Let there be a cone, in which the triangle through the axis is equal to $AB\Gamma$, and let it be cut by a plane parallel to the base, and let [the cutting plane] make the section ΔE , and let BH be the axis of the cone,

* For the circumscribed polygon is greater than the circle B, but the surface of the inscribed pyramid is less than the surface of the cone [Prop. 12] ; the explanation to this effect in the text is attributed by Heiberg to an interpolator.

¹ τὸ μὲν . . . τοῦ κώνου οἷον. Heiberg.

GREEK MATHEMATICS

ἐκ τοῦ κέντρου μέση ἀνάλογόν ἐστι τῆς τε $\Lambda\Delta$ καὶ συναμφοτέρου τῆς ΔZ , $H\Lambda$, ἔστω δὲ κύκλος ὁ Θ .

λέγω, ὅτι ὁ Θ κύκλος ἴσος ἐστὶ τῇ ἐπιφανείᾳ τοῦ κώνου τῇ μεταξὺ τῶν ΔE , $A\Gamma$.

Ἐκκείσθωσαν γὰρ κύκλοι οἱ Λ , K , καὶ τοῦ μὲν K κύκλου ἢ ἐκ τοῦ κέντρου δυνάσθω τὸ ὑπὸ $B\Delta Z$, τοῦ δὲ Λ ἢ ἐκ τοῦ κέντρου δυνάσθω τὸ ὑπὸ BAH . ὁ μὲν ἄρα Λ κύκλος ἴσος ἐστὶν τῇ ἐπιφανείᾳ τοῦ $AB\Gamma$ κώνου, ὁ δὲ K κύκλος ἴσος ἐστὶ τῇ ἐπιφανείᾳ τοῦ ΔEB . καὶ ἐπεὶ τὸ ὑπὸ τῶν BA , AH ἴσον ἐστὶ τῷ τε ὑπὸ τῶν $B\Delta$, ΔZ καὶ τῷ ὑπὸ τῆς $\Lambda\Delta$ καὶ συναμφοτέρου τῆς ΔZ , AH διὰ τὸ παράλληλον εἶναι τὴν ΔZ τῇ AH , ἀλλὰ τὸ μὲν ὑπὸ ΛB , ΛH δύναται ἢ ἐκ τοῦ κέντρου τοῦ Λ κύκλου, τὸ δὲ ὑπὸ $B\Delta$, ΔZ δύναται ἢ ἐκ τοῦ κέντρου τοῦ K κύκλου, τὸ δὲ ὑπὸ τῆς $\Lambda\Delta$ καὶ συναμφοτέρου τῆς ΔZ , AH δύναται ἢ ἐκ τοῦ κέντρου τοῦ Θ , τὸ ἄρα ἀπὸ τῆς ἐκ τοῦ κέντρου τοῦ Λ κύκλου ἴσον ἐστὶ τοῖς ἀπὸ τῶν ἐκ τῶν κέντρων τῶν K , Θ κύκλων· ὥστε καὶ ὁ Λ κύκλος ἴσος ἐστὶ τοῖς K , Θ κύκλοις.

ARCHIMEDES

and let there be set out a circle whose radius is a mean proportional between $\Lambda\Delta$ and the sum of ΔZ , HA , and let Θ be the circle ; I say that the circle Θ is equal to the portion of the surface of the cone between ΔE , $A\Gamma$.

For let the circles Λ , K be set out, and let the square of the radius of K be equal to the rectangle contained by $B\Delta$, ΔZ , and let the square of the radius of Λ be equal to the rectangle contained by BA , AH ; therefore the circle Λ is equal to the surface of the cone $AB\Gamma$, while the circle K is equal to the surface of the cone ΔEB [Prop. 14]. And since

$$BA \cdot AH = B\Delta \cdot \Delta Z + \Lambda\Delta \cdot (\Delta Z + AH)$$

because ΔZ is parallel to AH ,^a while the square of the radius of Λ is equal to $AB \cdot AH$, the square of the radius of K is equal to $B\Delta \cdot \Delta Z$, and the square of the radius of Θ is equal to $\Lambda\Delta \cdot (\Delta Z + AH)$, therefore the square on the radius of the circle Λ is equal to the sum of the squares on the radii of the circles K , Θ ; so that the circle Λ is equal to the sum of the circles

^a The proof is given by Eutocius as follows :

$$BA : AH = B\Delta : \Delta Z$$

$$\therefore BA \cdot \Delta Z = B\Delta \cdot AH. \quad [\text{Eucl. vi. 16}]$$

$$\text{But } BA \cdot \Delta Z = B\Delta \cdot \Delta Z + \Lambda\Delta \cdot \Delta Z. \quad [\text{Eucl. ii. 1}]$$

$$\therefore B\Delta \cdot AH = B\Delta \cdot \Delta Z + \Lambda\Delta \cdot \Delta Z.$$

Let $\Lambda\Delta \cdot AH$ be added to both sides.

$$\text{Then } B\Delta \cdot AH + \Lambda\Delta \cdot AH,$$

$$\text{i.e. } BA \cdot AH = B\Delta \cdot \Delta Z + \Lambda\Delta \cdot \Delta Z + \Lambda\Delta \cdot AH.$$

ἀλλ' ὁ μὲν Λ ἴσος ἐστὶ τῇ ἐπιφανείᾳ τοῦ ΒΑΓ κώνου, ὁ δὲ Κ τῇ ἐπιφανείᾳ τοῦ $\Delta\text{ΒΕ}$ κώνου· λοιπὴ ἄρα ἡ ἐπιφάνεια τοῦ κώνου ἡ μεταξὺ τῶν παραλλήλων ἐπιπέδων τῶν $\Delta\text{Ε}$, ΑΓ ἴση ἐστὶ τῷ Θ κύκλῳ.

K, Θ . But Λ is equal to the surface of the cone $B\Lambda\Gamma$, while K is equal to the surface of the cone ΔBE ; therefore the remainder, the portion of the surface of the cone between the parallel planes ΔE , $\Lambda\Gamma$, is equal to the circle Θ .

Prop. 21

If a regular polygon with an even number of sides be inscribed in a circle, and straight lines be drawn joining the angles ^a of the polygon, in such a manner as to be parallel to any one whatsoever of the lines subtended by two sides of the polygon, the sum of these connecting lines bears to the diameter of the circle the same ratio as the straight line subtended by half the sides less one bears to the side of the polygon.

Let $AB\Gamma\Delta$ be a circle, and in it let the polygon $AEZBH\Theta\Gamma M N \Delta A K$ be inscribed, and let EK , $Z\Lambda$, $B\Delta$, HN , ΘM be joined; then it is clear that they are parallel to a straight line subtended by two sides of the polygon ^b; I say therefore that the sum of the aforementioned straight lines bears to $\Lambda\Gamma$, the diameter of the circle, the same ratio as ΓE bears to EA .

For let ZK , ΛB , $H\Delta$, ΘN be joined; then ZK is parallel to EA , $B\Lambda$ to ZK , also ΔH to $B\Lambda$, ΘN to ΔH and ΓM to ΘN ^c; therefore

$$E\Xi : \Xi A = K\Xi : \Xi O.$$

But $K\Xi : \Xi O = Z\Pi : \Pi O$, [Eucl. vi. 4

^a "Sides" according to the text, but Heiberg thinks Archimedes probably wrote *γωνίας* where we have *πλευρὰς*.

^b For, because the arcs KA , EZ are equal, $\angle EKZ = \angle KZA$ [Eucl. iii. 27]; therefore EK is parallel to AZ ; and so on.

^c For, as the arcs AK , EZ are equal, $\angle AEK = \angle EKZ$, and therefore AE is parallel to ZK ; and so on.

¹ καὶ . . . ἕνα οὐκ. Heiberg.

ARCHIMEDES

while	$Z\Pi : \Pi O = \Delta\Pi : \Pi P,$	[<i>ibid.</i>
and	$\Delta\Pi : \Pi P = B\Sigma : \Sigma P.$	[<i>ibid.</i>
Again,	$B\Sigma : \Sigma P = \Delta\Sigma : \Sigma T,$	[<i>ibid.</i>
while	$\Delta\Sigma : \Sigma T = H\Upsilon : \Upsilon T.$	[<i>ibid.</i>
Again,	$H\Upsilon : \Upsilon T = N\Upsilon : \Upsilon\Phi,$	[<i>ibid.</i>
while	$N\Upsilon : \Upsilon\Phi = \Theta X : X\Phi.$	[<i>ibid.</i>
Again,	$\Theta X : X\Phi = M X : X\Gamma,$	[<i>ibid.</i>
therefore	$E\Xi : \Xi A = EK + ZA + B\Delta + HN +$ $\Theta M : A\Gamma.$ ^a	[Eucl. v. 12]
But	$E\Xi : \Xi A = \Gamma E : EA ;$	[Eucl. vi. 4]
therefore	$\Gamma E : EA = EK + ZA + B\Delta + HN +$ $\Theta M : A\Gamma.$ ^b	

^a By adding all the antecedents and consequents, for
 $E\Xi : \Xi A = E\Xi + EK + Z\Pi + \Delta\Pi + B\Sigma + \Delta\Sigma + H\Upsilon + N\Upsilon + \Theta X +$
 $MX : \Xi A + EO + \Pi O + \Pi P + \Sigma P + \Sigma T + \Upsilon T + \Upsilon\Phi$
 $+ X\Phi + X\Gamma$
 $= EK + ZA + B\Delta + HN + \Theta M : A\Gamma.$

^b If the polygon has $4n$ sides, then

$$\angle E\Gamma K = \frac{\pi}{2n} \quad \text{and} \quad EK : A\Gamma = \sin \frac{\pi}{2n},$$

$$\angle Z\Gamma A = \frac{2\pi}{2n} \quad \text{and} \quad ZA : A\Gamma = \sin \frac{2\pi}{2n},$$

$$\angle \Theta\Gamma M = (2n - 1) \frac{\pi}{2n} \quad \text{and} \quad \Theta M : A\Gamma = \sin (2n - 1) \frac{\pi}{2n}.$$

Further, $\angle A\Gamma E = \frac{\pi}{4n}$ and $\Gamma E : EA = \cot \frac{\pi}{4n}.$

Therefore the proposition shows that

$$\sin \frac{\pi}{2n} + \sin \frac{2\pi}{2n} + \dots + \sin (2n - 1) \frac{\pi}{2n} = \cot \frac{\pi}{4n}.$$

ARCHIMEDES

MN will traverse the surface of a certain cone whose base is the circle about the diameter MH and whose vertex is the point in which ZH, MN produced meet one another and with AG ; the sides BH, MA will traverse the surface of a cone whose base is the circle about the diameter BA at right angles to the circle ABG and whose vertex is the point in which BH, AM produced meet one another and with GA; in the same way the sides in the other semicircle will traverse surfaces of cones similar to these. As a result there will be inscribed in the sphere and bounded by the aforesaid surfaces of cones a figure whose surface will be less than the surface of the sphere.

For, if the sphere be cut by the plane through BA at right angles to the circle ABG, the surface of one of the hemispheres and the surface of the figure inscribed in it have the same extremities in one plane; for the extremity of both surfaces is the circumference of the circle about the diameter BA at right angles to the circle ABG; and both are concave in the same direction, and one of them is included by the other surface and the plane having the same extremities with it.^a Similarly the surface of the figure inscribed in the other hemisphere is less than the surface of the hemisphere; and therefore the whole surface of the figure in the sphere is less than the surface of the sphere.

tion, from Postulate 4, that the surface of the figure inscribed in the hemisphere is less than the surface of the hemisphere.

cones be imagined ; I say that the surface of the inscribed figure is less than four times the greatest of the circles inscribed in the sphere.

For let EI, ΘM, subtended by two sides of the polygon, be joined, and let ZK, ΔB, HΛ be parallel

to them, and let there be set out a circle P, the square of whose radius is equal to the rectangle contained by EA and a straight line equal to the sum of EI, ZK, BΔ, HΛ, ΘM ; by what has been proved above, the circle is equal to the surface of the aforesaid figure. And since it was proved that the ratio of the sum of EI, ZK, BΔ, HΛ, ΘM to AΓ, the diameter of the circle, is equal to the ratio of ΓE to EA [Prop. 21], therefore

$$EA \cdot (EI + ZK + B\Delta + H\Lambda + \Theta M)$$

that is, the square on the radius of the circle P

$$= A\Gamma \cdot \Gamma E. \quad [ex\ hyp. \quad Eucl. vi. 16]$$

But $A\Gamma \cdot \Gamma E < A\Gamma^2$. [Eucl. iii. 15]

Therefore the square on the radius of P is less than the square on AΓ ; therefore the circle P is less

GREEK MATHEMATICS

μεγίστου κύκλου. ὁ δὲ P κύκλος ἴσος ἐδείχθη τῇ εἰρημένῃ ἐπιφανείᾳ τοῦ σχήματος· ἡ ἄρα ἐπιφάνεια τοῦ σχήματος ἐλάσσων ἐστὶν ἢ τετραπλασία τοῦ μεγίστου κύκλου τῶν ἐν τῇ σφαίρᾳ.

than four times the greatest circle. But the circle P was proved equal to the aforesaid surface of the figure; therefore the surface of the figure is less than four times the greatest of the circles in the sphere.

Prop. 28

Let $AB\Gamma\Delta$ be the greatest circle in a sphere, and about the circle $AB\Gamma\Delta$ let there be circumscribed

an equilateral and equiangular polygon, the number of whose sides is divisible by four, and let a circle be described about the polygon circumscribing the circle, having the same centre as $AB\Gamma\Delta$. While EH remains stationary, let the plane $EZH\Theta$, in which lie both the polygon and the circle, be rotated; it is clear that the circumference of the circle $AB\Gamma\Delta$ will traverse the surface of the sphere, while the circumference of $EZH\Theta$ will traverse the surface of another

αὐτὸ κέντρον ἐχούσης τῇ ἐλάσσονι οἰσθήσεται, αἱ δὲ ἀφαί, καθ' ἃς ἐπιβαύουσιν αἱ πλευραί, γράφουσιν κύκλους ὀρθοὺς πρὸς τὸν ΑΒΓΔ κύκλον ἐν τῇ ἐλάσσονι σφαίρα, αἱ δὲ γωνίαι τοῦ πολυγώνου χωρὶς τῶν πρὸς τοῖς Ε, Η σημείοις κατὰ κύκλων περιφερειῶν οἰσθήσονται ἐν τῇ ἐπιφανείᾳ τῆς μείζονος σφαίρας γεγραμμένων ὀρθῶν πρὸς τὸν ΕΖΗΘ κύκλον, αἱ δὲ πλευραὶ τοῦ πολυγώνου κατὰ κωνικῶν ἐπιφανειῶν οἰσθήσονται, καθάπερ ἐπὶ τῶν πρὸ τούτου· ἔσται οὖν τὸ σχῆμα τὸ περιεχόμενον ὑπὸ τῶν ἐπιφανειῶν τῶν κωνικῶν περὶ μὲν τὴν ἐλάσσονα σφαῖραν περιγεγραμμένοι, ἐν δὲ τῇ μείζονι ἐγγεγραμμένοι. ὅτι δὲ ἡ ἐπιφάνεια τοῦ περιγεγραμμένου σχήματος μείζων ἐστὶ τῆς ἐπιφανείας τῆς σφαίρας, οὕτως δειχθήσεται.

Ἐστω γὰρ ἡ ΚΔ διάμετρος κύκλου τινὸς τῶν ἐν τῇ ἐλάσσονι σφαίρα τῶν Κ, Δ σημείων ὄντων, καθ' ἃ ἀπτονται τοῦ ΑΒΓΔ κύκλου αἱ πλευραὶ τοῦ περιγεγραμμένου πολυγώνου. διηρημένης δὲ τῆς σφαίρας ὑπὸ τοῦ ἐπιπέδου τοῦ κατὰ τὴν ΚΔ ὀρθοῦ πρὸς τὸν ΑΒΓΔ κύκλον καὶ ἡ ἐπιφάνεια τοῦ περιγεγραμμένου σχήματος περὶ τὴν σφαῖραν διαιρεθήσεται ὑπὸ τοῦ ἐπιπέδου. καὶ φανερόν, ὅτι τὰ αὐτὰ πέρατα ἔχουσιν ἐν ἐπιπέδῳ· ἀμφοτέρων γὰρ τῶν ἐπιπέδων πέρας ἐστὶν ἡ τοῦ κύκλου περιφέρεια τοῦ περὶ διάμετρον τὴν ΚΔ ὀρθοῦ πρὸς τὸν ΑΒΓΔ κύκλον· καὶ εἰσιν ἀμφοτέραι ἐπὶ τὰ αὐτὰ κοίλαι, καὶ περιλαμβάνεται ἡ ἑτέρα αὐτῶν ὑπὸ τῆς ἑτέρας ἐπιφανείας καὶ τῆς ἐπιπέδου τῆς τὰ αὐτὰ πέρατα ἐχούσης· ἐλάσσων οὖν ἐστὶν ἡ περιλαμβανομένη τοῦ τμήματος τῆς σφαίρας ἐπιφάνεια τῆς ἐπιφανείας τοῦ σχήματος τοῦ περι-

ARCHIMEDES

sphere, having the same centre as the lesser sphere ; the points of contact in which the sides touch [the smaller circle] will describe circles on the lesser sphere at right angles to the circle $AB\Gamma\Delta$, and the angles of the polygon, except those at the points E, H will traverse the circumferences of circles on the surface of the greater sphere at right angles to the circle $EZH\Theta$, while the sides of the polygon will traverse surfaces of cones, as in the former case ; there will therefore be a figure, bounded by surfaces of cones, described about the lesser sphere and inscribed in the greater. That the surface of the circumscribed figure is greater than the surface of the sphere will be proved thus.

Let $K\Delta$ be a diameter of one of the circles in the lesser sphere, K, Δ being points at which the sides of the circumscribed polygon touch the circle $AB\Gamma\Delta$. Now, since the sphere is divided by the plane containing $K\Delta$ at right angles to the circle $AB\Gamma\Delta$, the surface of the figure circumscribed about the sphere will be divided by the same plane. And it is manifest that they ^a have the same extremities in a plane ; for the extremity of both surfaces ^b is the circumference of the circle about the diameter $K\Delta$ at right angles to the circle $AB\Gamma\Delta$; and they are both concave in the same direction, and one of them is included by the other and the plane having the same extremities ; therefore the included surface of the segment of the sphere is less than the surface of

^a i.e., the surface formed by the revolution of the circular segment $K\Delta\Delta$ and the surface formed by the revolution of the portion $K \dots E \dots \Delta$ of the polygon.

^b In the text $\epsilon\pi\iota\mu\acute{\epsilon}\delta\omega\nu$ should obviously be $\epsilon\pi\iota\phi\alpha\nu\epsilon\iota\omega\nu$.

γεγραμμένου περιὶ αὐτήν. ὁμοίως δὲ καὶ ἡ τοῦ λοιποῦ τμήματος τῆς σφαίρας ἐπιφάνεια ἐλάσσων ἐστὶν τῆς ἐπιφανείας τοῦ σχήματος τοῦ περιγεγραμμένου περιὶ αὐτήν· δηλον οὖν, ὅτι καὶ ὅλη ἡ ἐπιφάνεια τῆς σφαίρας ἐλάσσων ἐστὶ τῆς ἐπιφανείας τοῦ σχήματος τοῦ περιγεγραμμένου περιὶ αὐτήν.

κθ'

Τῇ ἐπιφανείᾳ τοῦ περιγεγραμμένου σχήματος περιὶ τὴν σφαῖραν ἴσος ἐστὶ κύκλος, οὗ ἡ ἐκ τοῦ κέντρου ἴσον δύναται τῷ περιεχομένῳ ὑπὸ τε μιᾶς πλευρᾶς τοῦ πολυγώνου καὶ τῆς ἴσης πάσαις ταῖς ἐπιζευγνύουσαις τὰς γωνίας τοῦ πολυγώνου οὕσαις παρὰ τινὰ τῶν ὑπὸ δύο πλευρᾶς τοῦ πολυγώνου ὑποτείνουσών.

Τὸ γὰρ περιγεγραμμένον περιὶ τὴν ἐλάσσονα σφαῖραν ἐγγέγραπται εἰς τὴν μείζονα σφαῖραν· τοῦ δὲ ἐγγεγραμμένου ἐν τῇ σφαίρᾳ περιεχομένου ὑπὸ τῶν ἐπιφανειῶν τῶν κωνικῶν δέδεικται ὅτι τῇ ἐπιφανείᾳ ἴσος ἐστὶν ὁ κύκλος, οὗ ἡ ἐκ τοῦ κέντρου δύναται τὸ περιεχόμενον ὑπὸ τε μιᾶς πλευρᾶς τοῦ πολυγώνου καὶ τῆς ἴσης πάσαις ταῖς ἐπιζευγνύουσαις τὰς γωνίας τοῦ πολυγώνου οὕσαις παρὰ τινὰ τῶν ὑπὸ δύο πλευρᾶς ὑποτείνουσών· δηλον οὖν ἐστὶ τὸ προειρημένον. *

* If the radius of the inner sphere is a and that of the outer sphere a' , and the regular polygon has $4n$ sides, then

$$a' = a \sec \frac{\pi}{4n}.$$

This proposition shows that
 Area of figure circumscribed to circle of radius a = Area of figure inscribed in circle of radius a'

ARCHIMEDES

the figure circumscribed about it [Post. 4]. Similarly the surface of the remaining segment of the sphere is less than the surface of the figure circumscribed about it; it is clear therefore that the whole surface of the sphere is less than the surface of the figure circumscribed about it.

Prop. 29

The surface of the figure circumscribed about the sphere is equal to a circle, the square of whose radius is equal to the rectangle contained by one side of the polygon and a straight line equal to the sum of all the straight lines joining the angles of the polygon, being parallel to one of the straight lines subtended by two sides of the polygon.

For the figure circumscribed about the lesser sphere is inscribed in the greater sphere [Prop. 28]; and it has been proved that the surface of the figure inscribed in the sphere and formed by surfaces of cones is equal to a circle, the square of whose radius is equal to the rectangle contained by one side of the polygon and a straight line equal to the sum of all the straight lines joining the angles of the polygon, being parallel to one of the straight lines subtended by two sides [Prop. 24]; what was aforesaid is therefore obvious.^a

$$= 4\pi a'^2 \sin \frac{\pi}{4n} \left[\sin \frac{\pi}{2n} + \sin \frac{2\pi}{2n} + \dots + \sin (2n-1) \frac{\pi}{2n} \right],$$

ARCHIMEDES

Prop. 30

The surface of the figure circumscribed about the sphere is greater than four times the greatest of the circles in the sphere.

For let there be both the sphere and the circle and the other things the same as were posited before, and let the circle Λ be equal to the surface of the given figure circumscribed about the lesser sphere.

Therefore since in the circle $EZH\Theta$ there has been inscribed an equilateral polygon with an even number of angles, the [sum of the straight lines] joining the sides of the polygon, being parallel to $Z\Theta$, have the same ratio to $Z\Theta$ as ΘK to KZ [Prop. 21]; therefore the rectangle contained by one side of the polygon and the straight line equal to the sum of the straight lines joining the angles of the polygon is equal to the rectangle contained by $Z\Theta$, ΘK [Eucl. vi. 16]; so that the square of the radius of the circle Λ is equal to the rectangle contained by $Z\Theta$, ΘK

ἐστὶν ἡ ἐκ τοῦ κέντρου τοῦ Λ κύκλου τῆς ΘK .

¹ καὶ . . . ἄρα om. Heiberg.

² ἡ Β . . . ἢ περ om. Heiberg.

^a Archimedes would not have omitted these words.

^b On p. 100 n. a it was proved that the area of the inscribed figure is

$$4\pi a^2 \sin \frac{\pi}{n} \left[\sin \frac{\pi}{2n} + \sin \frac{3\pi}{2n} + \dots + \sin (2n-1) \frac{\pi}{2n} \right],$$

or $4\pi a^2 \cos \frac{\pi}{4n}$.

On p. 108 n. a it was proved that the area of the circumscribed figure is

$$4\pi a^2 \sec^2 \frac{\pi}{4n} \sin \frac{\pi}{4n} \left[\sin \frac{\pi}{2n} + \sin \frac{3\pi}{2n} + \dots + \sin (2n-1) \frac{\pi}{2n} \right],$$

or $4\pi a^2 \sec \frac{\pi}{4n}$.

ARCHIMEDES

I say now that neither is it less. For, if possible let it be ; and let the straight lines B, Γ be similarly found, so that B has to Γ a less ratio than that which the circle A has to the surface of the sphere, and let Δ be a mean proportional between B, Γ , and let [polygons] be again inscribed and circumscribed, so that the [side] of the circumscribed polygon has [to the side of the inscribed polygon] ^a a less ratio than that of B to Δ ; then the surface of the circumscribed polygon has to the surface of the inscribed polygon a ratio less than that which the circle A has to the surface of the sphere ; which is absurd ; for the surface of the circumscribed polygon is greater than the circle A , while that of the inscribed polygon is less than the surface of the sphere.

Therefore the surface of the sphere is not less than the circle A . And it was proved not to be greater ; therefore the surface of the sphere is equal to the circle A , that is to four times the greatest circle.^b

When n is indefinitely increased, the inscribed and circumscribed figures become identical with one another and with the circle, and, since $\cos \frac{\pi}{4n}$ and $\sec \frac{\pi}{4n}$ both become unity, the above expressions both give the area of the circle as $4\pi a^2$.

But the first expressions are, when n is indefinitely increased, precisely what is meant by the integral

$$4\pi a^2 \cdot \frac{1}{2} \int_0^\pi \sin \phi \, d\phi,$$

which is familiar to every student of the calculus as the formula for the area of a sphere and has the value $4\pi a^2$.

The Archimedes' procedure is equivalent to a genuine integration, but when it comes to the last stage, instead of saying, "Let the sides of the polygon be indefinitely

Πᾶσα σφαῖρα τετραπλασία ἐστὶ κώνου τοῦ βάσιν μὲν ἔχοντος ἴσην τῷ μεγίστῳ κύκλῳ τῶν ἐν τῇ σφαίρᾳ, ὕψος δὲ τὴν ἐκ τοῦ κέντρου τῆς σφαίρας.

Ἔστω γὰρ σφαῖρά τις καὶ ἐν αὐτῇ μέγιστος κύκλος ὁ ΑΒΓΔ. εἰ οὖν μὴ ἐστὶν ἡ σφαῖρα τε-

τραπλασία τοῦ εἰρημένου κώνου, ἔστω, εἰ δυνατόν, μείζων ἢ τετραπλασία· ἔστω δὲ ὁ Ξ κώνος βάσιν μὲν ἔχων τετραπλασίαν τοῦ ΑΒΓΔ κύκλου, ὕψος δὲ ἴσον τῇ ἐκ τοῦ κέντρου τῆς σφαίρας· μείζων οὖν ἐστὶν ἡ σφαῖρα τοῦ Ξ κώνου. ἔσται δὴ δύο μεγέθη ἄνισα ἢ τε σφαῖρα καὶ ὁ κώνος· δυνατόν οὖν δύο εὐθείας λαβεῖν ἄνισους, ὥστε ἔχειν τὴν

increased," he prefers to prove that the area of the sphere cannot be either greater or less than $4\pi a^2$. By this double *reductio ad absurdum* he avoids the logical difficulties of dealing with indefinitely small quantities, difficulties that were not fully overcome until recent times.

The procedure by which in this same book Archimedes

ARCHIMEDES

Prop. 34

Any sphere is four times as great as the cone having a base equal to the greatest of the circles in the sphere and height equal to the radius of the sphere.

For let there be a sphere in which $AB\Gamma\Delta$ is the greatest circle. If the sphere is not four times the

aforesaid cone, let it be, if possible, greater than four times; let Ξ be a cone having a base four times the circle $AB\Gamma\Delta$ and height equal to the radius of the sphere; then the sphere is greater than the cone Ξ . Accordingly there will be two unequal magnitudes, the sphere and the cone; it is therefore possible to take two unequal straight lines so that

finds the surface of the segment of a sphere is equivalent to the integration

$$\pi a^2 \int_0^a 2 \sin \theta \, d\theta = 2\pi a^2 (1 - \cos a).$$

Concurrently Archimedes finds the volumes of a sphere and segment of a sphere. He uses the same inscribed and circumscribed figures, and the procedure is equivalent to multiplying the above formulae by $\frac{1}{3}a$ throughout. Other "integrations" effected by Archimedes are the volume of a segment of a paraboloid of revolution, the volume of a segment of a hyperboloid of revolution, the volume of a segment of a spheroid, the area of a spiral and the area of a segment of a parabola. He also finds the area of an ellipse, but not by a method equivalent to integration. The subject is fully treated by Heath, *The Works of Archimedes*, pp. cxlii-cliv, to whom I am much indebted in writing this note.

μείζονα πρὸς τὴν ἐλάσσονα ἐλάσσονα λόγον τοῦ, ὃν ἔχει ἡ σφαῖρα πρὸς τὸν Ξ κῶνον. ἔστωσαν οὖν αἱ K , H , αἱ δὲ I , Θ εἰλημμένοι, ὥστε τῷ ἴσῳ ἀλλήλων ὑπερέχειν τὴν K τῆς I καὶ τὴν I τῆς Θ καὶ τὴν Θ τῆς H , νοείσθω δὲ καὶ εἰς τὸν $AB\Gamma\Delta$ κύκλον ἐγγεγραμμένον πολύγωνον, οὗ τὸ πλῆθος τῶν πλευρῶν μετρείσθω ὑπὸ τετράδος, καὶ ἄλλο περιγεγραμμένον ὁμοιον τῷ ἐγγεγραμμένῳ, καθάπερ ἐπὶ τῶν πρότερον, ἡ δὲ τοῦ περιγεγραμμένου πολυγώνου πλευρὰ πρὸς τὴν τοῦ ἐγγεγραμμένου ἐλάσσονα λόγον ἔχῃ τοῦ, ὃν ἔχει ἡ K πρὸς I , καὶ ἔστωσαν αἱ $A\Gamma$, $B\Delta$ διάμετροι πρὸς ὁρθὰς ἀλλήλαις. εἰ οὖν μενούσης τῆς $A\Gamma$ διαμέτρου περιενεχθεῖ τὸ ἐπίπεδον, ἐν ᾧ τὰ πολύγωνα, ἔσται σχήματα¹ τὸ μὲν ἐγγεγραμμένον ἐν τῇ σφαίρᾳ, τὸ δὲ περιγεγραμμένον, καὶ ἔξει τὸ περιγεγραμμένον πρὸς τὸ ἐγγεγραμμένον τριπλασίονα λόγον ἢ περ ἢ πλευρὰ τοῦ περιγεγραμμένου πρὸς τὴν τοῦ ἐγγεγραμμένου εἰς τὸν $AB\Gamma\Delta$ κύκλον. ἡ δὲ πλευρὰ πρὸς τὴν πλευρὰν ἐλάσσονα λόγον ἔχει ἢ περ ἢ K πρὸς τὴν I . ὥστε τὸ σχῆμα τὸ περιγεγραμμένον ἐλάσσονα λόγον ἔχει ἢ τριπλασίονα τοῦ K πρὸς I .

¹ σχήματα Heiberg, τὸ σχῆμα codd.

^a Eutocius supplies a proof on these lines. Let the lengths of K , I , Θ , H be a , b , c , d . Then $a - b = b - c = c - d$, and it is required to prove that $a : d > a^2 : b^2$.

Take x such that

$$a : b = b : x.$$

Then

$$a - b : a = b - x : b,$$

and since $a > b$,

$$a - b > b - x.$$

But, by hypothesis,

$$a - b = b - c.$$

Therefore

$$b - c > b - x,$$

and so

$$x > c.$$

ARCHIMEDES

the greater will have to the less a less ratio than that which the sphere has to the cone Ξ . Therefore let the straight lines K, H , and the straight lines I, Θ , be so taken that K exceeds I , and I exceeds Θ and Θ exceeds H by an equal quantity; let there be imagined inscribed in the circle $AB\Gamma\Delta$ a polygon the number of whose sides is divisible by four; let another be circumscribed similar to that inscribed so that, as before, the side of the circumscribed polygon has to the side of the inscribed polygon a ratio less than that $K:I$; and let $A\Gamma, B\Delta$ be diameters at right angles. Then if, while the diameter $A\Gamma$ remains stationary, the surface in which the polygons lie be revolved, there will result two [solid] figures, one inscribed in the sphere and the other circumscribed, and the circumscribed figure will have to the inscribed the triplicate ratio of that which the side of the circumscribed figure has to the side of the figure inscribed in the circle $AB\Gamma\Delta$ [Prop. 32]. But the ratio of the one side to the other is less than $K:I$ [*ex hypothesi*]; and so the circumscribed figure has [to the inscribed] a ratio less than $K^3:I^3$. But $^a K:H > K^3:I^3$; by much more there-

Again, take y such that $b:z = x:y$.

Then, as before $b-x > x-y$.

Therefore, *a fortiori*, $b-c > x-y$.

But, by hypothesis, $b-c = c-d$.

Therefore $c-d > x-y$.

But $x > c$,

and so $y > d$.

But, by hypothesis, $a:b = b:x = x:y$,

$a:y = a^3:b^3$ [Eucl. v. Def. 10, also vol. i.
p. 258 n. b,

Therefore $a:d > a^3:b^3$.

ἔχει δὲ καὶ ἡ K πρὸς H μείζονα λόγον ἢ τριπλάσιον τοῦ, ὃν ἔχει ἡ K πρὸς I [τοῦτο γὰρ φανερόν διὰ λημμάτων]¹. πολλῶ ἄρα τὸ περιγραφέν πρὸς τὸ ἐγγραφέν ἐλάσσονα λόγον ἔχει τοῦ, ὃν ἔχει ἡ K πρὸς H . ἡ δὲ K πρὸς H ἐλάσσονα λόγον ἔχει ἢ περ ἡ σφαῖρα πρὸς τὸν Ξ κώνον· καὶ ἐναλλάξ· ὅπερ ἀδύνατον· τὸ γὰρ σχῆμα τὸ περιγεγραμμένον μείζον ἐστι τῆς σφαίρας, τὸ δὲ ἐγγεγραμμένον ἐλάσσον τοῦ Ξ κώνου [διότι ὁ μὲν Ξ κώνος τετραπλάσιός ἐστι τοῦ κώνου τοῦ βάσιν μὲν ἔχοντος ἴσην τῷ $AB\Gamma\Delta$ κύκλῳ, ὕψος δὲ ἴσον τῇ ἐκ τοῦ κέντρου τῆς σφαίρας, τὸ δὲ ἐγγεγραμμένον σχῆμα ἐλάσσον τοῦ εἰρημένου κώνου ἢ τετραπλάσιον].² οὐκ ἄρα μείζων ἢ τετραπλασία ἡ σφαῖρα τοῦ εἰρημένου.

Ἐστω, εἰ δυνατόν, ἐλάσσων ἢ τετραπλασία· ὥστε ἐλάσσων ἐστὶν ἡ σφαῖρα τοῦ Ξ κώνου. εἰλήφθωσαν δὴ αἱ K , H εὐθεῖαι, ὥστε τὴν K μείζονα εἶναι τῆς H καὶ ἐλάσσονα λόγον ἔχειν πρὸς αὐτὴν τοῦ, ὃν ἔχει ὁ Ξ κώνος πρὸς τὴν σφαῖραν, καὶ αἱ Θ , I ἐκκείσθωσαν, καθὼς πρότερον, καὶ εἰς τὸν $AB\Gamma\Delta$ κύκλον νοείσθω πολύγωνον ἐγγεγραμμένον καὶ ἄλλο περιγεγραμμένον, ὥστε τὴν πλευρὰν τοῦ περιγεγραμμένου πρὸς τὴν πλευρὰν τοῦ ἐγγεγραμμένου ἐλάσσονα λόγον ἔχειν ἢ περ ἡ K πρὸς I , καὶ τὰ ἄλλα κατεσκευασμένα τὸν αὐτὸν τρόπον τοῖς πρότερον· ἔξει ἄρα καὶ τὸ περιγεγραμμένον στερεὸν σχῆμα πρὸς τὸ ἐγγεγραμμένον τριπλασίονα λόγον ἢ περ ἡ πλευρὰ τοῦ περιγεγραμμένου περὶ τὸν $AB\Gamma\Delta$ κύκλον πρὸς τὴν τοῦ ἐγγεγραμμένου. ἡ δὲ πλευρὰ πρὸς τὴν πλευρὰν ἐλάσσονα λόγον ἔχει

ARCHIMEDES

fore the circumscribed figure has to the inscribed a ratio less than $K : H$. But $K : H$ is a ratio less than that which the sphere has to the cone Ξ [*ex hypothesi*]; [therefore the circumscribed figure has to the inscribed a ratio less than that which the sphere has to the cone Ξ]; and *permutando*, [the circumscribed figure has to the sphere a ratio less than that which the inscribed figure has to the cone]^a; which is impossible; for the circumscribed figure is greater than the sphere [Prop. 28], but the inscribed figure is less than the cone Ξ [Prop. 27]. Therefore the sphere is not greater than four times the aforesaid cone.

Let it be, if possible, less than four times, so that the sphere is less than the cone Ξ . Let the straight lines K, H be so taken that K is greater than H and $K : H$ is a ratio less than that which the cone Ξ has to the sphere [Prop. 2]; let the straight lines Θ, I be placed as before; let there be imagined in the circle $AB\Gamma\Delta$ one polygon inscribed and another circumscribed, so that the side of the circumscribed figure has to the side of the inscribed a ratio less than $K : I$; and let the other details in the construction be done as before. Then the circumscribed solid figure will have to the inscribed the triplicate ratio of that which the side of the figure circumscribed about the circle $AB\Gamma\Delta$ has to the side of the inscribed figure [Prop. 32]. But the ratio of the sides

^a A marginal note in one MS. gives these words, which Archimedes would not have omitted.

ARCHIMEDES

is less than $K : I$ [*ex hypothesi*]; therefore the circumscribed figure has to the inscribed a ratio less than $K^3 : I^3$. But $K : H > K^3 : I^3$; and so the circumscribed figure has to the inscribed a ratio less than $K : H$. But $K : H$ is a ratio less than that which the cone Ξ has to the sphere [*ex hypothesi*]; [therefore the circumscribed figure has to the inscribed a ratio less than that which the cone Ξ has to the sphere]^a; which is impossible; for the inscribed figure is less than the sphere [Prop. 28], but the circumscribed figure is greater than the cone Ξ [Prop. 31, coroll.]. Therefore the sphere is not less than four times the cone having its base equal to the circle $AB\Gamma\Delta$, and height equal to the radius of the sphere. But it was proved that it cannot be greater; therefore it is four times as great.

[COROLLARY]

From what has been proved above it is clear that *any cylinder having for its base the greatest of the circles in the sphere, and having its height equal to the diameter of the sphere, is one-and-a-half times the sphere, and its surface including the bases is one-and-a-half times the surface of the sphere.*

For the aforesaid cylinder is six times the cone having the same basis and height equal to the radius [from Eucl. xii. 10], while the sphere was proved to be four times the same cone [Prop. 34]. It is obvious therefore that the cylinder is one-and-a-half times the sphere. Again, since the surface of the cylinder excluding the bases has been proved equal to a circle

^a These words, which Archimedes would not have omitted, are given in a marginal note to one ms.

τοῦ κέντρου μέση ἀνάλογόν ἐστι τῆς τοῦ κυλίνδρου πλευρᾶς καὶ τῆς διαμέτρου τῆς βάσεως, τοῦ δὲ εἰρημένου κυλίνδρου τοῦ περὶ τὴν σφαῖραν ἡ πλευρὰ ἴση ἐστὶ τῇ διαμέτρῳ τῆς βάσεως [δῆλον, ὅτι ἡ μέση αὐτῶν ἀνάλογον ἴση γίνεται τῇ διαμέτρῳ τῆς βάσεως],¹ ὁ δὲ κύκλος ὁ τὴν ἐκ τοῦ κέντρου ἔχων ἴσην τῇ διαμέτρῳ τῆς βάσεως τετραπλάσιός ἐστι τῆς βάσεως, τουτέστι τοῦ μεγίστου κύκλου τῶν ἐν τῇ σφαίρᾳ, ἔσται ἄρα καὶ ἡ ἐπιφάνεια τοῦ κυλίνδρου χωρὶς τῶν βάσεων τετραπλάσια τοῦ μεγίστου κύκλου. ὅλη ἄρα μετὰ τῶν βάσεων ἡ ἐπιφάνεια τοῦ κυλίνδρου, ἑξαπλάσια ἔσται τοῦ μεγίστου κύκλου. ἔστιν δὲ καὶ ἡ τῆς σφαίρας ἐπιφάνεια τετραπλάσια τοῦ μεγίστου κύκλου. ὅλη ἄρα ἡ ἐπιφάνεια τοῦ κυλίνδρου ἡμιολία ἐστὶ τῆς ἐπιφανείας τῆς σφαίρας.

(c) SOLUTION OF A CUBIC EQUATION

Archim. *De Sphaera et Cyl.* ii., Prop. 4, Archim. ed.
Heiberg i. 186. 15-192. 6

ARCHIMEDES

whose radius is a mean proportional between the side of the cylinder and the diameter of the base [Prop. 13], and the side of the aforementioned cylinder circumscribing the sphere is equal to the diameter of the base, while the circle having its radius equal to the diameter of the base is four times the base [Eucl. xii. 2], that is to say, four times the greatest of the circles in the sphere, therefore the surface of the cylinder excluding the bases is four times the greatest circle; therefore the whole surface of the cylinder, including the bases, is six times the greatest circle. But the surface of the sphere is four times the greatest circle. Therefore the whole surface of the cylinder is one-and-a-half times the surface of the sphere.

(c) SOLUTION OF A CUBIC EQUATION

Archimedes, *On the Sphere and Cylinder* ii.,
Prop. 4, Archim. ed. Heiberg i. 186. 15-192. 6

To cut a given sphere, so that the segments of the sphere shall have, one towards the other, a given ratio.^a

straight line the same ratio as a given area bears to the square on ΔX "; in algebraical notation, to solve the equation

$$\frac{a-x}{b} = \frac{c^2}{x^2}, \text{ or } x^2(a-x) = bc^2.$$

(b) Analysis of this general problem, in which it is shown that the required point can be found as the intersection of a parabola [$ax^2 = c^2y$] and a hyperbola [$(a-x)y = ab$]. It is stated, for the time being without proof, that $x^2(a-x)$ is greatest when $x = \frac{2}{3}a$; in other words, that for a real solution $bc^2 > \frac{8}{27}a^3$.

(c) Synthesis of this general problem, according as bc^2 is greater than, equal to, or less than $\frac{8}{27}a^3$. If it be greater, there is no real solution; if equal, there is one real solution; if less, there are two real solutions.

(d) Proof that $x^2(a-x)$ is greatest when $x = \frac{2}{3}a$, deferred

Ἐστω ἡ δοθεῖσα σφαῖρα ἡ ΑΒΓΔ· δεῖ δὴ αὐτὴν τεμεῖν ἐπιπέδῳ, ὥστε τὰ τμήματα τῆς σφαίρας πρὸς ἄλληλα λόγον ἔχειν τὸν δοθέντα.

Τετμήσθω διὰ τῆς ΑΓ ἐπιπέδῳ· λόγος ἄρα τοῦ ΑΔΓ τμήματος τῆς σφαίρας πρὸς τὸ ΑΒΓ τμήμα τῆς σφαίρας δοθεῖς. τετμήσθω δὲ ἡ σφαῖρα διὰ τοῦ κέντρου, καὶ ἔστω ἡ τομὴ μέγιστος κύκλος ὁ ΑΒΓΔ, κέντρον δὲ τὸ Κ καὶ διάμετρος ἡ ΔΒ, καὶ πεποιήσθω, ὡς μὲν συναμφοτέρος ἡ ΚΔΧ πρὸς ΔΧ, οὕτως ἡ ΡΧ πρὸς ΧΒ, ὡς δὲ συναμφοτέρος ἡ ΚΒΧ πρὸς ΒΧ, οὕτως ἡ ΛΧ πρὸς ΧΔ, καὶ ἐπεζεύχθωσαν αἱ ΑΛ, ΛΓ, ΑΡ, ΡΓ· ἴσος ἄρα ἐστὶν ὁ μὲν ΑΔΓ κῶνος τῷ ΑΔΓ τμήματι τῆς σφαίρας, ὁ δὲ ΑΡΓ τῷ ΑΒΓ· λόγος ἄρα καὶ τοῦ ΑΔΓ κῶνου πρὸς τὸν ΑΡΓ κῶνον δοθεῖς. ὡς δὲ ὁ κῶνος πρὸς τὸν κῶνον, οὕτως ἡ ΛΧ πρὸς ΧΡ [ἐπεὶπερ τὴν αὐτὴν βάσιν ἔχουσιν τὸν περὶ διάμετρον τὴν ΑΓ κύκλον]¹. λόγος ἄρα καὶ τῆς ΛΧ πρὸς ΧΡ δοθεῖς. καὶ διὰ ταῦτα τοῖς πρό-

¹ ἐπεὶπερ . . . κύκλον om. Heiberg.

in (b). This is done in two parts, by showing that (1) if w has any value less than $\frac{2}{3}a$, (2) if w has any value greater than $\frac{2}{3}a$, then $w^2(a-w)$ has a smaller value than when $w = \frac{2}{3}a$.

(e) Proof that, if $bc^2 < \frac{1}{27}a^3$, there are always two real solutions.

(f) Proof that, in the particular case of the general problem to which Archimedes has reduced his original problem, there is always a real solution.

(g) Synthesis of the original problem.

Of these stages, (a) and (g) alone are found in our texts of Archimedes; but Eutocius found stages (b)-(d) in an old book, which he took to be the work of Archimedes; and he added stages (e) and (f) himself. When it is considered that all these stages are traversed by rigorous geometrical

ARCHIMEDES

Let $AB\Gamma\Delta$ be the given sphere; it is required so to cut it by a plane that the segments of the sphere shall have, one towards the other, the given ratio.

Let it be cut by the plane $A\Gamma$; then the ratio of the segment $\Delta\Delta\Gamma$ of the sphere to the segment $AB\Gamma$ of the sphere is given. Now let the sphere be cut through the centre [by a plane perpendicular to the plane through $A\Gamma$], and let the section be the great circle $\Delta B\Gamma\Delta$ of centre K and diameter ΔB ; and let [Λ , P be taken on $B\Delta$ produced in either direction so that]

$$K\Delta + \Delta X : \Delta X = PX : XB,$$

$$KB + BX : BX = \Lambda X : X\Delta,$$

and let $\Lambda\Lambda$, $\Lambda\Gamma$, ΛP , $P\Gamma$ be joined; then the cone $\Lambda\Lambda\Gamma$ is equal to the segment $\Lambda\Delta\Gamma$ of the sphere, and

the cone APT to the segment $AB\Gamma$ [Prop. 2]; therefore the ratio of the cone $\Lambda\Lambda\Gamma$ to the cone APT is given. But cone $\Lambda\Lambda\Gamma : \text{cone } APT = \Lambda X : XP$.^a Therefore the ratio $\Lambda X : XP$ is given. And in the

methods, the solution must be admitted a veritable *tour de force*. It is strictly analogous to the modern method of solving a cubic equation, but the concept of a cubic equation did not, of course, come within the purview of the ancient mathematicians.

^a Since they have the same base.

τερον διὰ τῆς κατασκευῆς, ὡς ἡ $\Lambda\Delta$ πρὸς $\text{Κ}\Delta$, ἡ $\text{Κ}\text{Β}$ πρὸς $\text{Β}\text{Ρ}$ καὶ ἡ $\Delta\text{Χ}$ πρὸς $\text{Χ}\text{Β}$. καὶ ἐπεὶ ἐστίν, ὡς ἡ $\text{Ρ}\text{Β}$ πρὸς $\text{Β}\text{Κ}$, ἡ $\text{Κ}\Delta$ πρὸς $\Lambda\Delta$, συνθέντι, ὡς ἡ $\text{Ρ}\text{Κ}$ πρὸς $\text{Κ}\text{Β}$, τουτέστι πρὸς $\text{Κ}\Delta$, οὕτως ἡ $\text{Κ}\Lambda$ πρὸς $\Lambda\Delta$ · καὶ ὅλη ἄρα ἡ $\text{Ρ}\Lambda$ πρὸς ὅλην τὴν $\text{Κ}\Lambda$ ἐστίν, ὡς ἡ $\text{Κ}\Lambda$ πρὸς $\Lambda\Delta$. ἴσον ἄρα τὸ ὑπὸ τῶν $\text{Ρ}\Lambda\Delta$ τῷ ἀπὸ $\Lambda\text{Κ}$. ὡς ἄρα ἡ $\text{Ρ}\Lambda$ πρὸς $\Lambda\Delta$, τὸ ἀπὸ $\text{Κ}\Lambda$ πρὸς τὸ ἀπὸ $\Lambda\Delta$. καὶ ἐπεὶ ἐστίν, ὡς ἡ $\Lambda\Delta$ πρὸς $\Delta\text{Κ}$, οὕτως ἡ $\Delta\text{Χ}$ πρὸς $\text{Χ}\text{Β}$, ἔσται ἀνάπαλιν καὶ συνθέντι, ὡς ἡ $\text{Κ}\Lambda$ πρὸς $\Lambda\Delta$, οὕτως ἡ $\text{Β}\Delta$ πρὸς $\Delta\text{Χ}$ [καὶ ὡς ἄρα τὸ ἀπὸ $\text{Κ}\Lambda$ πρὸς τὸ ἀπὸ $\Lambda\Delta$, οὕτως τὸ ἀπὸ $\text{Β}\Delta$ πρὸς τὸ ἀπὸ $\Delta\text{Χ}$. πάλιν, ἐπεὶ ἐστίν, ὡς ἡ $\Lambda\text{Χ}$ πρὸς $\Delta\text{Χ}$, συναμφότερος ἡ $\text{Κ}\text{Β}$, $\text{Β}\text{Χ}$ πρὸς $\text{Β}\text{Χ}$, διελόντι, ὡς ἡ $\Lambda\Delta$ πρὸς $\Delta\text{Χ}$, οὕτως ἡ $\text{Κ}\text{Β}$ πρὸς $\text{Β}\text{Χ}$].¹ καὶ κείσθω τῇ $\text{Κ}\text{Β}$ ἴση ἡ $\text{Β}\text{Ζ}$. ὅτι γὰρ ἐκτὸς τοῦ Ρ πεσεῖται, δῆλον [καὶ ἐστίν, ὡς ἡ $\Lambda\Delta$ πρὸς $\Delta\text{Χ}$, οὕτως ἡ $\text{Ζ}\text{Β}$ πρὸς $\text{Β}\text{Χ}$. ὥστε καί, ὡς ἡ $\Delta\Lambda$ πρὸς $\Lambda\text{Χ}$, ἡ $\text{Β}\text{Ζ}$ πρὸς $\text{Ζ}\text{Χ}$].² ἐπεὶ δὲ λόγος ἐστὶ τῆς $\Delta\Lambda$ πρὸς $\Lambda\text{Χ}$ δοθείς, καὶ τῆς $\text{Ρ}\Lambda$ ἄρα πρὸς $\Lambda\text{Χ}$ λόγος ἐστὶ

¹ καὶ . . . πρὸς $\text{Β}\text{Χ}$. The words καὶ . . . ἀπὸ $\Delta\text{Χ}$ are shown by Eutocius's comment to be an interpolation. The words πάλιν . . . πρὸς $\text{Β}\text{Χ}$ and καὶ . . . πρὸς $\text{Ζ}\text{Χ}$ must also be interpolated, as, in order to prove that $\Delta\Lambda : \Lambda\text{Χ}$ is given, Eutocius first proves that $\text{Β}\text{Ζ} : \text{Ζ}\Lambda :: \Lambda\Delta : \Lambda\text{Χ}$, which he would hardly have done if Archimedes had himself provided the proof.

² καὶ . . . πρὸς $\text{Ζ}\text{Χ}$: c. preceding note.

^a This is proved by Eutocius thus :

Since	$\text{Κ}\Delta + \Delta\text{Χ} : \Delta\text{Χ} = \text{Ρ}\text{Χ} : \text{Χ}\text{Β},$
<i>dirimendo</i> ,	$\text{Κ}\Delta : \Delta\text{Χ} = \text{Ρ}\text{Β} : \text{Β}\text{Χ},$
and <i>permutando</i> ,	$\text{Κ}\Delta : \text{Β}\text{Ρ} = \Delta\text{Χ} : \text{Χ}\text{Β},$
<i>i.e.</i> ,	$\text{Κ}\text{Β} : \text{Β}\text{Ρ} = \Delta\text{Χ} : \text{Χ}\text{Β}.$
Again, since	$\text{Κ}\text{Β} + \text{Β}\text{Χ} : \text{Χ}\text{Β} = \Lambda\text{Χ} : \text{Χ}\Delta,$

ARCHIMEDES

same way as in a previous proposition [Prop. 2], by construction,

$$\Delta\Delta : K\Delta = KB : BP = \Delta X : XB.^a$$

And since $PB : BK = K\Delta : \Delta\Delta$, [Eucl. v. 7, coroll.

componendo, $PK : KB = K\Delta : \Delta\Delta$, [Eucl. v. 18

i.e., $PK : K\Delta = K\Delta : \Delta\Delta$.

$\therefore PA : K\Delta = K\Delta : \Delta\Delta$. [Eucl. v. 12

$\therefore PA \cdot \Delta\Delta = \Delta K^2$. [Eucl. vi. 17

$\therefore PA : \Delta\Delta = K\Delta^2 : \Delta\Delta^2$.

And since $\Delta\Delta : \Delta K = \Delta X : XB$,

invertendo et componendo, $K\Delta : \Delta\Delta = B\Delta : \Delta X$. [Eucl. v. 7, coroll. and v. 18

Let BZ be placed equal to KB. It is plain that [Z] will fall beyond P.^b Since the ratio $\Delta\Delta : \Delta X$ is given, therefore the ratio $PA : \Delta X$ is given.^c Then,

dirimendo et permutando $\Delta X : XB = \Delta\Delta : \Delta K$.

Now $\Delta X : XB = KB : BP$.

Therefore $\Delta\Delta : \Delta K = \Delta X : XB = KB : BP$.

^b Since $X\Delta : XB = KB : BP$, and $\Delta X > XB$, $\therefore KB > BP$.
 $\therefore BZ > BP$.

^c As Eutocius's note shows, what Archimedes wrote was: "Since the ratio $\Delta\Delta : \Delta X$ is given, and the ratio $PA : \Delta X$, therefore the ratio $PA : \Delta\Delta$ is also given." Eutocius's proof is:

Since $KB + BX : BX = \Delta X : X\Delta$,

$\therefore ZX : XB = \Delta X : X\Delta$;

$\therefore XZ : ZB = X\Delta : \Delta\Delta$;

$\therefore BZ : ZX = \Delta\Delta : \Delta X$.

But the ratio $BZ : ZX$ is given because ZB is equal to the radius of the given sphere and BX is given. Therefore $\Delta\Delta : \Delta X$ is given.

Again, since the ratio of the segments is given, the ratio of

δοθείς. ἐπεὶ οὖν ὁ τῆς ΡΑ πρὸς ΑΧ λόγος συν-
 ῆπται ἔκ τε τοῦ, ὃν ἔχει ἡ ΡΑ πρὸς ΑΔ, καὶ ἡ
 ΔΑ πρὸς ΑΧ, ἀλλ' ὡς μὲν ἡ ΡΑ πρὸς ΑΔ, τὸ
 ἀπὸ ΔΒ πρὸς τὸ ἀπὸ ΔΧ, ὡς δὲ ἡ ΔΑ πρὸς ΑΧ,
 οὕτως ἡ ΒΖ πρὸς ΖΧ, ὁ ἄρα τῆς ΡΑ πρὸς ΑΧ
 λόγος συνῆπται ἔκ τε τοῦ, ὃν ἔχει τὸ ἀπὸ ΒΔ
 πρὸς τὸ ἀπὸ ΔΧ, καὶ ἡ ΒΖ πρὸς ΖΧ. πεποιήσθω

 πρὸς ΖΧ. ἀλλ' ὁ ΒΖ πρὸς ΖΘ λόγος συνῆπται
 ἔκ τε τοῦ τῆς ΒΖ πρὸς ΖΧ καὶ τοῦ τῆς ΖΧ πρὸς
 ΖΘ [κοινὸς ἀφηγήσθω ὁ τῆς ΒΖ πρὸς ΖΧ]¹.
 λοιπὸν ἄρα ἐστίν, ὡς τὸ ἀπὸ ΒΔ, τουτέστι δοθέν,
 πρὸς τὸ ἀπὸ ΔΧ, οὕτως ἡ ΧΖ πρὸς ΖΘ, τουτέστι
 πρὸς δοθέν. καὶ ἐστὶν δοθεῖσα ἡ ΖΔ εὐθεῖα·
 εὐθείαν ἄρα δοθεῖσαν τὴν ΔΖ τεμεῖν δεῖ κατὰ τὸ
 Χ καὶ ποιεῖν, ὡς τὴν ΧΖ πρὸς δοθεῖσαν [τὴν ΖΘ],²
 οὕτως τὸ δοθέν [τὸ ἀπὸ ΒΔ]³ πρὸς τὸ ἀπὸ ΔΧ,
 τοῦτο οὕτως ἀπλῶς μὲν λεγόμενον ἔχει διορισμόν,

¹ κοινὸς . . . πρὸς ΖΧ. Eutocius's comment shows that these words are interpolated.

² τὴν ΖΘ, τὸ ἀπὸ ΒΔ. Eutocius's comments show these words to be glosses.

the cones ΑΑΓ, ΑΡΓ is also given, and therefore the ratio ΑΧ:ΧΡ. Therefore the ratio ΡΑ:ΑΧ is given. Since the ratios ΡΑ:ΑΧ and ΑΔ:ΑΧ are given, it follows that the ratio ΡΑ:ΑΔ is given.

ARCHIMEDES

since the ratio $PA : AX$ is composed of the ratios $PA : \Lambda\Delta$ and $\Delta\Lambda : \Lambda X$,

and since $PA : \Lambda\Delta = \Delta B^2 : \Delta X^2$,^a

$$\Delta\Lambda : \Lambda X = BZ : ZX,$$

therefore the ratio $PA : \Lambda X$ is composed of the ratios $\Delta B^2 : \Delta X^2$ and $BZ : ZX$. Let $[\Theta$ be chosen so that]

$$PA : \Lambda X = BZ : Z\Theta.$$

Now the ratio $PA : \Lambda X$ is given; therefore the ratio $ZB : Z\Theta$ is given. Now BZ is given—for it is equal to the radius; therefore $Z\Theta$ is also given. Therefore^b the ratio $BZ : Z\Theta$ is composed of the ratios $\Delta B^2 : \Delta X^2$ and $BZ : ZX$. But the ratio $BZ : Z\Theta$ is composed of the ratios $BZ : ZX$ and $ZX : Z\Theta$. Therefore, the remainder^c $\Delta B^2 : \Delta X^2 = XZ : Z\Theta$, in which ΔB^2 and $Z\Theta$ are given. And the straight line $Z\Delta$ is given; therefore *it is required so to cut the given straight line ΔZ at X that XZ bears to a given straight line the same ratio as a given area bears to the square on ΔX .* When the problem is stated in this general form,^d it is necessary to investigate the limits of possibility,

$$\begin{aligned} \text{" For } \quad PA : \Lambda\Delta &= \Delta K^2 : \Delta\Lambda^2 \\ &= \Delta B^2 : \Delta X^2. \end{aligned}$$

^b "Therefore" refers to the last equation.

^c i.e. the remainder in the process given fully by Eutocius as follows:

$$(\Delta B^2 : \Delta X^2) \cdot (BZ : ZX) = BZ : \Theta Z = (BZ : ZX) \cdot (XZ : Z\Theta).$$

Removing the common element $BZ : ZX$ from the extreme terms, we find that the remainder $\Delta B^2 : \Delta X^2 = XZ : Z\Theta$.

^d In algebraic notation, if $\Delta X = x$ and $\Delta Z = a$, while the given straight line is b and the given area is c^2 , then

$$\frac{a-x}{b} = \frac{c^2}{x^2},$$

or

$$x^2(a-x) = bc^2.$$

προστιθεμένων δὲ τῶν προβλημάτων τῶν ἐνθάδε ὑπαρχόντων [τουτέστι τοῦ τε διπλασίαν εἶναι τὴν ΔB τῆς BZ καὶ τοῦ μείζονα τῆς $\text{Z}\Theta$ τὴν ZB , ὡς κατὰ τὴν ἀνάλυσιν]¹ οὐκ ἔχει διορισμόν· καὶ ἔσται τὸ πρόβλημα τοιοῦτον· δύο δοθεισῶν εὐθειῶν τῶν $\text{B}\Delta$, BZ καὶ διπλασίας οὔσης τῆς $\text{B}\Delta$ τῆς BZ καὶ σημείου ἐπὶ τῆς BZ τοῦ Θ τεμεῖν τὴν ΔB κατὰ τὸ X καὶ ποιεῖν, ὡς τὸ ἀπὸ $\text{B}\Delta$ πρὸς τὸ ἀπὸ ΔX , τὴν XZ πρὸς $\text{Z}\Theta$ · ἐκάτερα δὲ ταῦτα ἐπὶ τέλει ἀναλυθήσεται τε καὶ συντεθήσεται.

Eutoc. *Comm. in Archim. De Sphaera et Cyl.* ii., Archim.
ed. Heiberg iii. 130. 17–150. 22

Ἐπὶ τέλει μὲν τὸ προρηθὲν ἐπηγγεῖλατο δεῖξαι, ἐν οὐδενὶ δὲ τῶν ἀντιγράφων εὐρεῖν ἔνεστι τὸ ἐπάγγελμα. ὅθεν καὶ Διονυσόδωρον μὲν εὐρίσκομεν μὴ τῶν αὐτῶν ἐπιτυχόντα, ἀδυνατήσαντα δὲ ἐπιβαλεῖν τῷ καταλειφθέντι λήμματι, ἑφ' ἑτέραν ὁδὸν τοῦ ὅλου προβλήματος ἐλθεῖν, ἥντινα ἐξῆς γράψομεν· Διοκλῆς μέντοι καὶ αὐτὸς ἐν τῷ Περὶ πυρίων αὐτῷ συγγεγραμμένῳ βιβλίῳ ἐπηγγέλλεται νομίζων τὸν Ἀρχιμήδη, μὴ πεποιηκέναι δὲ τὸ ἐπάγγελμα, αὐτὸς ἀναπληροῦν ἐπεχείρησεν, καὶ τὸ ἐπιχείρημα ἐξῆς γράψομεν· ἔστιν γὰρ καὶ αὐτὸ οὐδένα μὲν ἔχον πρὸς τὰ παραλελειμμένα λόγον, ὁμοίως δὲ τῷ Διονυσοδώρῳ δι' ἑτέρας ἀποδείξεως κατασκευάζον τὸ πρόβλημα. ἔν τινι μέντοι παλαιῷ

ARCHIMEDES

but under the conditions of the present case no such investigation is necessary.^a In the present case the problem will be of this nature: *Given two straight lines $B\Delta$, BZ , in which $B\Delta = 2BZ$, and a point Θ upon BZ , so to cut ΔB at X that*

$$B\Delta^2 : \Delta X^2 = XZ : Z\Theta :$$

and the analysis and synthesis of both problems will be given at the end.^b

Eutocius, *Commentary on Archimedes' Sphere and Cylinder* ii., Archim. ed. Heiberg ii. 190: 17-150. 22

He promised that he would give at the end a proof of what is stated, but the fulfilment of the promise cannot be found in any of his extant writings. Dionysodorus also failed to light on it, and, being unable to tackle the omitted lemma, he approached the whole problem in an altogether different way, which I shall describe in due course. Diocles, indeed, in his work *On Burning Mirrors* maintained that Archimedes made the promise but had not fulfilled it, and he undertook to supply the omission himself, which attempt I shall also describe in its turn; it bears, however, no relation to the missing discussion, but, like that of Dionysodorus, it solves the problem by a construction reached by a different proof. But

general problem requires a *diorismos*, for which v. vol. i. p. 151 n. *h* and p. 396 n. *a*. In algebraic notation, there must be limiting conditions if the equation

$$x^2(a-x) = bc^2$$

is to have a real root lying between 0 and a .

^b Having made this promise, Archimedes proceeded to give the formal synthesis of the problem which he had thus reduced.

ARCHIMEDES

in a certain ancient book—for I pursued the inquiry thoroughly—I came upon some theorems which, though far from clear owing to errors and to manifold faults in the diagrams, nevertheless gave the substance of what I sought, and furthermore preserved in part the Doric dialect beloved by Archimedes, while they kept the names favoured by ancient custom, the parabola being called a section of a right-angled cone and the hyperbola a section of an obtuse-angled cone; in short, I felt bound to consider whether these theorems might not be what he had promised to give at the end. For this reason I applied myself with closer attention, and, although it was difficult to get at the true text owing to the multitude of the mistakes already mentioned, gradually I routed out the meaning and now set it out, so far as I can, in more familiar and clearer language. In the first place the theorem will be treated generally, in order to make clear what he says about the limits of possibility; then will follow the special form it takes under the conditions of his analysis of the problem.

“ Given a straight line AB and another straight line $\Delta\Gamma$ and an area Δ , let it be required to find a point E on AB such that $AE : \Delta\Gamma = \Delta : EB^2$.

“ Suppose it found, and let $\Delta\Gamma$ be at right angles to AB , and let ΓE be joined and produced to Z , and through Γ let ΓH be drawn parallel to AB , and through B let ZBH be drawn parallel to $\Delta\Gamma$, meeting

ἐκατέρᾳ τῶν ΓΕ, ΓΗ, καὶ συμπεπληρώσθω τὸ ΗΘ παραλληλόγραμμον, καὶ διὰ τοῦ Ε ὁποτέρᾳ τῶν ΓΘ, ΗΖ παράλληλος ῥῥθω ἡ ΚΕΛ, καὶ τῷ Δ ἴσον ἔστω τὸ ὑπὸ ΓΗΜ.

“ Ἐπεὶ οὖν ἐστίν, ὡς ἡ ΕΑ πρὸς ΑΙ', οὕτως τὸ Δ πρὸς τὸ ἀπὸ ΕΒ, ὡς δὲ ἡ ΕΑ πρὸς ΑΙ', οὕτως ἡ ΓΗ πρὸς ΗΖ, ὡς δὲ ἡ ΓΗ πρὸς ΗΖ, οὕτως τὸ ἀπὸ ΓΗ πρὸς τὸ ὑπὸ ΓΗΖ, ὡς ἄρα τὸ ἀπὸ ΓΗ πρὸς τὸ ὑπὸ ΓΗΖ, οὕτως τὸ Δ πρὸς τὸ ἀπὸ ΕΒ, τουτέστι πρὸς τὸ ἀπὸ ΚΖ· καὶ ἐναλλάξ, ὡς τὸ ἀπὸ ΓΗ πρὸς τὸ Δ, τουτέστι πρὸς τὸ ὑπὸ ΓΗΜ, οὕτως τὸ ὑπὸ ΓΗΖ πρὸς τὸ ἀπὸ ΖΚ. ἀλλ' ὡς τὸ ἀπὸ ΓΗ πρὸς τὸ ὑπὸ ΓΗΜ, οὕτως ἡ ΓΗ πρὸς ΗΜ· καὶ ὡς ἄρα ἡ ΓΗ πρὸς ΗΜ, οὕτως τὸ ὑπὸ ΓΗΖ πρὸς τὸ ἀπὸ ΖΚ. ἀλλ' ὡς ἡ ΓΗ πρὸς ΗΜ, τῆς ΗΖ κοινοῦ ὕψους λαμβανόμενης οὕτως τὸ ὑπὸ ΓΗΖ πρὸς τὸ ὑπὸ ΜΗΖ· ὡς ἄρα τὸ ὑπὸ ΓΗΖ πρὸς τὸ ὑπὸ ΜΗΖ, οὕτως τὸ ὑπὸ ΓΗΖ πρὸς τὸ ἀπὸ ΖΚ· ἴσον ἄρα τὸ ὑπὸ ΜΗΖ τῷ ἀπὸ ΖΚ. ἐὰν ἄρα περὶ ἄξονα τὴν ΖΗ

ARCHIMEDES

both ΓE and ΓH , and let the parallelogram $H\Theta$ be completed, and through E let KEA be drawn parallel

to either $\Gamma\Theta$ or HZ , and let $[M$ be taken so that]

$$\Gamma H \cdot HM = \Delta.$$

“ Then, since $EA : A\Gamma = \Delta : EB^2$ [*ex hyp.*]
and $EA : A\Gamma = \Gamma H : HZ$,

and $\Gamma H : HZ = \Gamma H^2 : \Gamma H \cdot HZ$,

$$\therefore \Gamma H^2 : \Gamma H \cdot HZ = \Delta : EB^2 \\ = \Delta : KZ^2;$$

and, *permutando*, $\Gamma H^2 : \Delta = [\Gamma H \cdot HZ : ZK^2]$

i.e., $\Gamma H^2 : \Gamma H \cdot HM = \Gamma H \cdot HZ : ZK^2$.

But $\Gamma H^2 : \Gamma H \cdot HM = \Gamma H : HM$;

$$\therefore \Gamma H : HM = \Gamma H \cdot HZ : ZK^2.$$

But, by taking a common altitude HZ ,

$$\Gamma H : HM = \Gamma H \cdot HZ : MH \cdot HZ;$$

$$\therefore \Gamma H \cdot HZ : MH \cdot HZ = \Gamma H \cdot HZ : ZK^2;$$

$$\therefore MH \cdot HZ = ZK^2.$$

γραφῇ διὰ τοῦ Η παραβολή, ὥστε τὰς καταγο-
μένας δύνασθαι παρὰ τὴν ΗΜ, ἥξει διὰ τοῦ Κ,

“ Let $AB = a$, $AG = b$, and $\Delta = \Gamma\text{II}$. $HM = c^2$, so that $HIM = \frac{c^2}{a}$.

Then if HT be taken as the axis of x and HI as the axis of y , the equation of the parabola is

$$x^2 = \frac{c^2}{a}y,$$

and the equation of the hyperbola is

$$(a - x)y = ab.$$

Their points of intersection give solutions of the equation

$$x^2(a - x) = b^2.$$

ARCHIMEDES

If, therefore, a parabola be drawn through H about the axis ZH with the parameter HM, it will pass through K [Apoll. *Con.* i. 11, converse], and it will be given in position because HM is given in magnitude [Eucl. *Data* 57], comprehending with the given straight line HΓ the given area Δ; therefore K lies on a parabola given in position. Let it then be drawn, as described, and let it be HK. *

“ Again, since the area $\Theta\Lambda = \Gamma B$ [Eucl. i. 43

i.e.,

$$\Theta K \cdot K\Lambda = AB \cdot BH,$$

if a hyperbola be drawn through B having $\Theta\Gamma$, ΓH for asymptotes, it will pass through K by the converse to the eighth theorem of the second book of Apollonius's *Elements of Conics*, and it will be given in position because both the straight lines $\Theta\Gamma$, ΓH , and also the point B, are given in position. Let it be drawn, as described, and let it be KB; therefore K lies on a hyperbola given in position. But it lies also on a parabola given in position; therefore K is given.^a And KE is the perpendicular drawn from it to the straight line AB given in position; therefore E is given. Now since the ratio of EA to the given straight line AΓ is equal to the ratio of the given area Δ to the square on EB, we have two solids, whose bases are the square on EB and Δ and whose altitudes are EA, AΓ, and the bases are inversely pro-

to which, as already noted, Archimedes had reduced his problem. (N.B.—The axis of x is for convenience taken in a direction contrary to that which is usual; with the usual conventions, we should get slightly different equations.)

θασιν αἱ βάσεις τοῖς ὕψεσιν· ὥστε ἴσα ἐστὶ τὰ στερεά· τὸ ἄρα ἀπὸ ΕΒ ἐπὶ τὴν ΕΑ ἴσον ἐστὶ τῷ δοθέντι τῷ Δ ἐπὶ δοθείσαν τὴν ΓΑ. ἀλλὰ τὸ ἀπὸ ΒΕ ἐπὶ τὴν ΕΑ μέγιστόν ἐστι πάντων τῶν ὁμοίως λαμβανομένων ἐπὶ τῆς ΒΑ, ὅταν ἢ διπλασία ἢ ΒΕ τῆς ΕΑ, ὡς δειχθήσεται· δεῖ ἄρα τὸ δοθὲν ἐπὶ τὴν δοθείσαν μὴ μείζον εἶναι τοῦ ἀπὸ τῆς ΒΕ ἐπὶ τὴν ΕΑ.

“Συντεθήσεται δὲ οὕτως· ἔστω ἡ μὲν δοθείσα εὐθεῖα ἡ ΑΒ, ἄλλη δέ τις δοθείσα ἡ ΑΓ, τὸ δὲ δοθὲν χωρίον τὸ Δ, καὶ δέον ἔστω τεμεῖν τὴν ΑΒ, ὥστε εἶναι, ὡς τὸ ἐν τμήμα πρὸς τὴν δοθείσαν τὴν ΑΓ, οὕτως τὸ δοθὲν τὸ Δ πρὸς τὸ ἀπὸ τοῦ λοιποῦ τμήματος.

“Εἰλήφθω τῆς ΑΒ τρίτον μέρος ἡ ΑΕ· τὸ ἄρα Δ ἐπὶ τὴν ΑΓ ἥτοι μείζον ἐστὶ τοῦ ἀπὸ τῆς ΒΕ ἐπὶ τὴν ΕΑ ἢ ἴσον ἢ ἔλασσον.

“Εἰ μὲν οὖν μείζον ἐστίν, οὐ συντεθήσεται, ὡς ἐν τῇ ἀναλύσει δέδεικται· εἰ δὲ ἴσον ἐστί, τὸ Ε σημεῖον ποιήσει τὸ πρόβλημα. ἴσων γὰρ ὄντων τῶν στερεῶν ἀντιπεπόνθασιν αἱ βάσεις τοῖς ὕψεσιν, καὶ ἐστίν, ὡς ἡ ΕΑ πρὸς ΑΓ, οὕτως τὸ Δ πρὸς τὸ ἀπὸ ΒΕ.

“Εἰ δὲ ἔλασσόν ἐστι τὸ Δ ἐπὶ τὴν ΑΓ τοῦ ἀπὸ ΒΕ ἐπὶ τὴν ΕΑ, συντεθήσεται οὕτως· κείσθω ἡ ΑΓ πρὸς ὀρθὰς τῇ ΑΒ, καὶ διὰ τοῦ Γ τῇ ΑΒ παρ-

^a In our algebraical notation, $x^2(a - x)$ is a maximum when $x = \frac{2}{3}a$. We can easily prove this by the calculus. For, by differentiating and equating to zero, we see that $x^2(a - x)$ has

ARCHIMEDES

portional to the altitudes ; therefore the solids are equal [Eucl. xi. 34] ; therefore

$$EB^2 \cdot EA = \Delta \cdot \Gamma A,$$

in which both Δ and ΓA are given. But, of all the figures similarly taken upon BA , $BE^2 \cdot BA$ is greatest when $BE = 2EA$,^a as will be proved ; it is therefore necessary that the product of the given area and the given straight line should not be greater than

$$BE^2 \cdot EA.^b$$

.

“ The synthesis is as follows : Let AB be the given straight line,^c let ΓA be any other given straight line, let Δ be the given area, and let it be required to cut AB so that the ratio of one segment to the given straight line ΓA shall be equal to the ratio of the given area Δ to the square on the remaining segment.

“ Let AE be taken, the third part of AB ; then $\Delta \cdot \Gamma A$ is greater than, equal to or less than $BE^2 \cdot EA$.

“ If it is greater, no synthesis is possible, as was shown in the analysis ; if it is equal, the point E satisfies the conditions of the problem. For in equal solids the bases are inversely proportional to the altitudes, and $EA : \Gamma A = \Delta : BE^2$.

“ If $\Delta \cdot \Gamma A$ is less than $BE^2 \cdot EA$, the synthesis is thus accomplished^d: let AI' be placed at right angles to AB , and through Γ let ΓZ be drawn parallel to

a stationary value when $2ax - 3x^2 = 0$, i.e., when $x = 0$ (which gives a minimum value) or $x = \frac{2}{3}a$ (which gives a maximum). No such easy course was open to Archimedes.

^b *Sc.* “ not greater than $BE^2 \cdot EA$ when $BE = 2EA$.”

^c Figure on p. 146.

ARCHIMEDES

AB, and through B let BZ be drawn parallel to AF, and let it meet ΓE produced at H, and let the parallelogram ZΘ be completed, and through E let KEA be drawn parallel to ZH. Now

since $\Delta . A\Gamma < BE^2 . EA$,

$\therefore EA : A\Gamma = \Delta : (\text{the square of some quantity less than } BE)$.
 $= \Delta : (\text{the square of some quantity less than } HK)$.

Let $EA : A\Gamma = \Delta : HM^2$,

and let $\Delta = \Gamma Z . ZN$.

Then $EA : A\Gamma = \Delta : HM^2$
 $= \Gamma Z . ZN : HM^2$.

But $EA : A\Gamma = \Gamma Z : ZH$,

and $\Gamma Z : ZH = \Gamma Z^2 : \Gamma Z . ZH$;

$\therefore \Gamma Z^2 : \Gamma Z . ZH = \Gamma Z . ZN : HM^2$;

and *permutando*, $\Gamma Z^2 : \Gamma Z . ZN = \Gamma Z . ZH : HM^2$.

But $\Gamma Z^2 : \Gamma Z . ZN = \Gamma Z : ZN$,

and $\Gamma Z : ZN = \Gamma Z . ZH : NZ . ZH$,

by taking a common altitude ZH ;

and $\therefore \Gamma Z . ZH : NZ . ZH = \Gamma Z . ZH : HM^2$;

$\therefore HM^2 = HZ . ZN$.

“ Therefore if we describe through Z a parabola about the axis ZH and with parameter ZN, it will pass through M. Let it be described, and let it be as MZZ. Then since

$\Theta\Lambda = AZ$, [Eucl. i. 43

i.e. $\Theta K . K\Lambda = AB . BZ$,

ARCHIMEDES

if we describe through B a hyperbola in the asymptotes $\Theta\Gamma$, ΓZ , it will pass through K by the converse of the eighth theorem [of the second book] of Apollonius's *Elements of Conics*. Let it be described, and let it be as BK cutting the parabola in Ξ , and from Ξ let $\Xi O\Pi$ be drawn perpendicular to AB, and through Ξ let $P\Xi\Sigma$ be drawn parallel to AB. Then since B Ξ K is a hyperbola and $\Theta\Gamma$, ΓZ are its asymptotes, while P Ξ , $\Xi\Pi$ are parallel to AB, BZ,

$$P\Xi \cdot \Xi\Pi = AB \cdot BZ; \quad [\text{Apoll. ii. 12}]$$

$$\therefore PO = OZ.$$

Therefore if a straight line be drawn from Γ to Σ it will pass through O [Eucl. i. 48, converse]. Let it be drawn, and let it be as $\Gamma O\Sigma$. Then since

$$\begin{aligned} OA : A\Gamma &= OB : B\Sigma & [\text{Eucl. vi. 4}] \\ &= \Gamma Z : Z\Sigma, \end{aligned}$$

$$\text{and} \quad \Gamma Z : Z\Sigma = \Gamma Z : ZN : \Sigma Z : ZN,$$

by taking a common altitude ZN,

$$\therefore OA : A\Gamma = \Gamma Z : ZN : \Sigma Z : ZN.$$

And $\Gamma Z \cdot ZN = \Delta$, $\Sigma Z \cdot ZN = \Sigma\Xi^2 = BO^2$, by the property of the parabola [Apoll. i. 11].

$$\therefore OA : A\Gamma = \Delta : BO^2;$$

χωρίον πρὸς τὸ ἀπὸ τῆς ΒΟ. εἴληπται ἄρα τὸ Ο σημεῖον ποιοῦν τὸ πρόβλημα.

ARCHIMEDES

therefore the point O has been found satisfying the conditions of the problem.

"That $BE^2 \cdot EA$ is the greatest of all the figures similarly taken upon BA when $BE = 2EA$ will be thus proved. Let there again be, as in the analysis, a given straight line AF at right angles to AB ,^a and let FE be joined and let it, when produced, meet at Z the line through B drawn parallel to AF , and through F, Z let OZ , GH be drawn parallel to AB , and let FA be produced to Θ , and through E let KEA be drawn parallel to it, and let

$$EA : AF = GH : HM : EB^2 ;$$

then $BE^2 \cdot EA = (GH \cdot HM) \cdot AF$,

owing to the fact that in two [equal] solids the bases are inversely proportional to the altitudes. I assert, then, that $(GH \cdot HM) \cdot AF$ is the greatest of all the figures similarly taken upon BA.

"For let there be described through H a parabola about the axis ZH and with parameter HM; it will pass through K, as was proved in the analysis, and, if produced, it will meet ΘF , being parallel to the axis^b of the parabola, by the twenty-seventh theorem of the first book of Apollonius's *Elements of Conics*.^c Let it be produced, and let it meet at N, and through B let a hyperbola be drawn in the asymptotes NF , GH ; it will pass through K, as was shown in the analysis. Let it be described as BK, and let ZH be produced to Ξ so that $ZH = H\Xi$, and let ΞK be joined

* In the same notation as before, the condition $BE^2 \cdot EA = (GH \cdot HM) \cdot AG$ is $\frac{4}{27}a^3 = bc^2$; and Archimedes has proved that, when this condition holds, the parabola $w^2 = \frac{c^2}{a}y$ touches the hyperbola $(a - w)y = ab$ at the point $(\frac{2}{3}a, 3b)$ because they both touch at this point the same straight line, that is the

ARCHIMEDES

$\triangle OK$ is similar to the triangle $\triangle ZK$, so that $\triangle K = 2\triangle KO$. But $\triangle K = 2\triangle K\Pi$ because $\triangle Z = 2\triangle H$ and ΠH is parallel to KZ ; therefore $OK = K\Pi$. Therefore $OK\Pi$, which meets the hyperbola and lies between the asymptotes, is bisected; therefore, by the converse of the third theorem of the second book of Apollonius's *Elements of Conics*, it is a tangent to the hyperbola. But it touches the parabola at the same point K . Therefore the parabola touches the hyperbola at K .^a

"Let the hyperbola be therefore conceived as produced to P , and upon AB let any point Σ be taken, and through Σ let TSY be drawn parallel to $K\Lambda$ and let it meet the hyperbola at T , and through T let ΦTX be drawn parallel to ΓH . Now by virtue of the property of the hyperbola and its asymptotes, $\Phi Y = \Gamma B$, and, the common element $\Gamma \Sigma$ being subtracted, $\Phi \Sigma = \Sigma H$, and therefore the straight line drawn from Γ to X will pass through Σ [Eucl. i. 43, conv.]. Let it be drawn, and let it be as $\Gamma \Sigma X$. Then since, in virtue of the property of the parabola,

$$\Psi X^2 = XH \cdot HM, \quad [\text{Apoll. i. 11}]$$

line $9bx - ay - 3ab = 0$, as may easily be shown. We may prove this fact in the following simple manner. Their points of intersection are given by the equation

$$x^2(a - x) = bc^2,$$

which may be written

$$x^3 - ax^2 + \frac{4}{27}a^3 = \frac{4}{27}a^3 - bc^2,$$

$$\text{or} \quad \left(x - \frac{2}{3}a\right)^2 \left(x + \frac{a}{3}\right) = \frac{4}{27}a^3 - bc^2.$$

Therefore, when $bc^2 = \frac{4}{27}a^3$ there are two coincident solutions, $x = \frac{2}{3}a$, lying between 0 and a , and a third solution

$x = -\frac{a}{3}$, outside that range.

ἐστὶ τοῦ ὑπὸ XHM . γεγονέτω οὖν τῷ ἀπὸ TX ἴσον τὸ ὑπὸ $XH\Omega$. ἐπεὶ οὖν ἐστίν, ὡς ἡ ΣA πρὸς $A\Gamma$, οὕτως ἡ ΓH πρὸς HX , ἀλλ' ὡς ἡ ΓH πρὸς HX , τῆς $H\Omega$ κοινοῦ ὕψους λαμβανομένης οὕτως τὸ ὑπὸ $\Gamma H\Omega$ πρὸς τὸ ὑπὸ $XH\Omega$ καὶ πρὸς τὸ ἴσον αὐτῷ τὸ ἀπὸ XT , τουτέστι τὸ ἀπὸ $B\Sigma$, τὸ ἄρι ἀπὸ $B\Sigma$ ἐπὶ τὴν ΣA ἴσον ἐστὶ τῷ ὑπὸ $\Gamma H\Omega$ ἐπὶ τὴν ΓA . τὸ δὲ ὑπὸ $\Gamma H\Omega$ ἐπὶ τὴν ΓA ἔλασσόν ἐστὶ τοῦ ὑπὸ ΓHM ἐπὶ τὴν ΓA . τὸ ἄρι ἀπὸ $B\Sigma$ ἐπὶ τὴν ΣA ἔλαττόν ἐστὶ τοῦ ἀπὸ BE ἐπὶ τὴν EA . ὁμοίως δὴ δειχθήσεται καὶ ἐπὶ πάντων τῶν σημείων τῶν μεταξὺ λαμβανομένων τῶν E, B .

ARCHIMEDES

$$\therefore TX^2 < XH \cdot HM.$$

$$\text{Let } TX^2 = XH \cdot H\Omega.$$

$$\text{Then since } \Sigma A : A\Gamma = \Gamma H : HX,$$

$$\text{while } \Gamma H : HX = \Gamma H \cdot H\Omega : XH \cdot H\Omega,$$

by taking a common altitude $H\Omega$,

$$= \Gamma H \cdot H\Omega : XT^2$$

$$= \Gamma H \cdot H\Omega : B\Sigma^2,$$

$$\therefore B\Sigma^2 \cdot \Sigma A = (\Gamma H \cdot H\Omega) \cdot \Gamma A.$$

$$\text{But } (\Gamma H \cdot H\Omega) \cdot \Gamma A < (\Gamma H \cdot HM) \cdot \Gamma A ;$$

$$\therefore B\Sigma^2 \cdot \Sigma A < BE^2 \cdot EA.$$

This can be proved similarly for all points taken between E, B .

“ Now let there be taken a point ς between E, A . I assert that in this case also $BE^2 \cdot EA > B\varsigma \cdot \varsigma A$.

“ With the same construction, let ςP be drawn^a through ς parallel to KA and let it meet the hyperbola at P^2 ; it will meet the hyperbola because it is parallel to an asymptote [Apoll. ii. 13]; and through P let $A'PB'$ be drawn parallel to AB and let it meet HZ produced in B' . Since, in virtue of the property of the hyperbola, $\Gamma'\varsigma = \Lambda H$, the straight line drawn from Γ to B' will pass through ς [Eucl. i. 43, conv.]. Let it be drawn and let it be as $\Gamma\varsigma B'$. Again, since, in virtue of the property of the parabola,

$$A'B'^2 = B'H \cdot HM,$$

$$\therefore PB'^2 < B'H \cdot HM.$$

$$\text{Let } PB'^2 = B'H \cdot H\Omega.$$

$$\text{Then since } \varsigma A : A\Gamma = \Gamma H : HB',$$

$$\text{while } \Gamma H : HB' = \Gamma H \cdot H\Omega : B'H \cdot H\Omega,$$

^a There is some uncertainty where the quotation from Archimedes ends and Eutocius's comments are resumed. Heiberg, with some reason, makes Eutocius resume his comments at this point.

^b In the mss. the figures on pp. 150 and 156 are com-

ARCHIMEDES

This can be proved similarly for all points taken between E, A. And it was proved for all points between E, B; therefore for all figures similarly taken upon AB, $BE^2 \cdot EA$ is greatest when $BE = 2EA$.^a

The following consequences^a should also be noticed in the aforementioned figure.^b Inasmuch as it has been proved that

$$B\Sigma^2 \cdot \Sigma A < BE^2 \cdot$$

and

$$B\varsigma^2 \cdot \varsigma A < BE^2 \cdot EA,$$

if the product of the given space and the given straight line is less than $BE^2 \cdot EA$, it is possible to cut AB in two points satisfying the conditions of the original problem.^c This comes about if we conceive a parabola described about the axis XH with parameter HΩ; for such a parabola will necessarily pass through T.^d And since it must necessarily meet ΓN, being parallel to a diameter [Apoll. Con. i. 26], it is clear that it cuts the hyperbola in another point above K, as at P in this case, and a perpendicular drawn from P to AB, as Pς in this case, will cut AB in ς, so that the point ς satisfies the conditions of the

bined; in this edition it is convenient, for the sake of clarity, to give separate figures.

^c With the same notation as before this may be stated:

when $b\sigma^2 < \frac{4}{27}a^3$, there are always two real solutions of the cubic equation $x^2(a-x) = b\sigma^2$ lying between 0 and a . If the cubic has two real roots it must, of course, have a third real root as well, but the Greeks did not recognize negative solutions.

^d By Apoll. i. 11, since $TX^2 = XH \cdot H\Omega$.

βλημα, καὶ ἴσον γίνεσθαι τὸ ἀπὸ ΒΣ ἐπὶ τὴν ΣΑ τῷ ἀπὸ Βς ἐπὶ τὴν ΣΑ, ὥς ἐστὶ διὰ τῶν προειρημένων ἀποδείξεων ἐμφανές. ὥστε δυνατοῦ ὄντος ἐπὶ τῆς ΒΑ δύο σημεία λαμβάνειν ποιοῦντα τὸ ζητούμενον, ἔξεστιν, ὁποτέρον τις βούλοιτο, λαμβάνειν ἢ τὸ μεταξὺ τῶν Ε, Β ἢ τὸ μεταξὺ τῶν Ε, Α. εἰ μὲν γὰρ τὸ μεταξὺ τῶν Ε, Β, ὥς εἴρηται, τῆς διὰ τῶν Η, Τ σημείων γραφομένης παραβολῆς κατὰ δύο σημεία τεμνούσης τὴν ὑπερβολὴν τὸ μὲν ἐγγύτερον τοῦ Η, τουτέστι τοῦ ἄξονος τῆς παραβολῆς, εὐρήσει τὸ μεταξὺ τῶν Ε, Β, ὥς ἐνταῦθα τὸ Τ εὐρίσκει τὸ Σ, τὸ δὲ ἀπωτέρω τὸ μεταξὺ τῶν Ε, Α, ὥς ἐνταῦθα τὸ Ρ εὐρίσκει τὸ Σ.

Καθόλου μὲν οὖν οὕτως ἀναλέλονται καὶ συντέθεται τὸ πρόβλημα· ἵνα δὲ καὶ τοῖς Ἀρχιμηδεῖοις ῥήμασιν ἐφαρμοσθῇ, νενοήσθω ὥς ἐν αὐτῇ τῇ τοῦ ῥήτου καταγραφῇ διάμετρος μὲν τῆς σφαίρας ἢ ΔΒ, ἢ δὲ ἐκ τοῦ κέντρου ἢ ΒΖ, καὶ ἡ δεδομένη ἢ ΖΘ. κατηντήσαμεν ἄρα, φησὶν, εἰς τὸ “τὴν ΔΖ τεμεῖν κατὰ τὸ Χ, ὥστε εἶναι, ὥς τὴν ΧΖ πρὸς τὴν δοθείσαν, οὕτως τὸ δοθὲν πρὸς τὸ ἀπὸ τῆς ΔΧ. τοῦτο δὲ ἀπλῶς μὲν λεγόμενον ἔχει διορισμόν.” εἰ γὰρ τὸ δοθὲν ἐπὶ τὴν δοθείσαν μείζον ἐτύγγχανεν τοῦ ἀπὸ τῆς ΔΒ ἐπὶ τὴν ΒΖ, ἀδύνατον ἦν τὸ πρόβλημα, ὥς δέδεικται, εἰ δὲ ἴσον, τὸ Β σημεῖον ἐποίει τὸ πρόβλημα, καὶ οὕτως δὲ οὐδὲν ἦν πρὸς τὴν ἐξ ἀρχῆς Ἀρχιμήδους πρόθεσιν· ἢ γὰρ σφαῖρα οὐκ ἐτέμνετο εἰς τὸν δοθέντα

^a Archimedes' figure is re-drawn (v. page 162) so that B, Z come on the left of the figure and Δ on the right, instead of B, Z on the right and Δ on the left.

^b v. *supra*, p. 133.

ARCHIMEDES

problem, and $B\Sigma^2 \cdot \Sigma A = B\zeta^2 \cdot \zeta A$, as is clear from the above proof. Inasmuch as it is possible to take on BA two points satisfying what is sought, it is permissible to take whichever one wills, either the point between E, B or that between E, A. If we choose the point between E, B, the parabola described through the points H, T will, as stated, cut the hyperbola in two points; of these the one nearer to H, that is to the axis of the parabola, will determine the point between E, B, as in this case T determines Σ , while the point farther away will determine the point between E, A, as in this case P determines ζ .

The analysis and synthesis of the general problem have thus been completed; but in order that it may be harmonized with Archimedes' words, let there be conceived, as in Archimedes' own figure,^a a diameter ΔB of the sphere, with radius [equal to] BZ , and a given straight line $Z\Theta$. We are therefore faced with the problem, he says, "so to cut ΔZ at X that XZ bears to the given straight line the same ratio as the given area bears to the square on ΔX . When the problem is stated in this general form, it is necessary to investigate the limits of possibility."^b If therefore the product of the given area and the given straight line chanced to be greater than $\Delta B^2 \cdot BZ$,^c the problem would not admit a solution, as was proved, and if it were equal the point B would satisfy the conditions of the problem, which also would be of no avail for the purpose Archimedes set himself at the outset; for the sphere would not be

^a For $\Delta B = \frac{2}{3}\Delta Z$ [*ex hyp.*], and so ΔB in the figure on p. 162 corresponds with BE in the figure on p. 146, while BZ in the figure on p. 162 corresponds with EA in the figure on p. 146.

* Entocius proceeds to give solutions of the problem by Dionysodorus and Diocles, by whose time, as he has explained, Archimedes' own solution had already disappeared. Dionysodorus solves the less general equation by means of the intersection of a parabola and a rectangular hyperbola; Diocles solves the general problem by the intersection of an ellipse with a rectangular hyperbola, and his proof is both ingenious and intricate. Details may be consulted in Heath, *H.G.M.* ii. 46-49 and more fully in Heath, 162

ARCHIMEDES

cut in the given ratio. Therefore when the problem was stated generally, an investigation of the limits of possibility was necessary as well; "but under the conditions of the present case," that is, if $\Delta B = 2ZB$ and $BZ > Z\Theta$, "no such investigation is necessary." For the product of the given area ΔB^2 into the given straight line $Z\Theta$ is less than the product of ΔB^2 into BZ by reason of the fact that BZ is greater than $Z\Theta$, and we have shown that in this case there is a solution, and how it can be effected.⁴

The Works of Archimedes, pp. cxxiii-cxli, which deals with the whole subject of cubic equations in Greek mathematical history. It is there pointed out that the problem of finding mean proportionals is equivalent to the solution of a pure cubic equation, $\frac{a^3}{x^3} = \frac{a}{b}$, and that Menaechmus's solution, by the intersection of two conic sections (v. vol. i. pp. 278-283), is the precursor of the method adopted by Archimedes, Dionysodorus and Diocles. The solution of cubic equations by means of conics was, no doubt, found easier than a solution by the manipulation of parallelepipeds, which would have been analogous to the solution of quadratic equations by the application of areas (v. vol. i. pp. 186-215). No other examples of the solution of cubic equations have survived, but in his preface to the book *On Conoids and Spheroids* Archimedes says the results there obtained can be used to solve other problems, including the following, "from a given spheroidal figure or conoid to cut off, by a plane drawn parallel to a given plane, a segment which shall be equal to a given cone or cylinder, or to a given sphere" (Archim. ed. Heiberg i. 258. 11-15); the case of the paraboloid of revolution does not lead to a cubic equation, but those of the spheroid and hyperboloid of revolution do lead to cubics, which Archimedes may be presumed to have solved. The conclusion reached by Heath is that Archimedes solved completely, so far as the real roots are concerned, a cubic equation in which the term in x is absent: and as all cubic equations can be reduced to this form, he may be regarded as having solved geometrically the general cubic.

ARCHIMEDES

(d) CONOIDS AND SPHEROIDS

(i.) *Preface*

Archimedes, *On Conoids and Spheroids*, Preface,
Archim. ed. Heiberg i. 246. 1-14

Archimedes to Dositheus greeting.

I have written out and now send you in this book the proofs of the remaining theorems, which you did not have among those sent to you before,^a and also of some others discovered later, which I had often tried to investigate previously but their discovery was attended with some difficulty and I was at a loss over them; and for this reason not even the propositions themselves were forwarded with the rest. But later, when I had studied them more carefully, I discovered what had left me at a loss before. Now the remainder of the earlier theorems were propositions about the *right-angled conoid*^b; but the discoveries now added relate to an *obtuse-angled conoid*^c and to *spheroidal figures*, of which I call some *oblong* and others *flat*.^d

(ii.) *Two Lemmas*

Ibid., Lemma to Prop. 1, Archim. ed. Heiberg
i. 260. 17-24

If there be a series of magnitudes, as many as you please, in which each term exceeds the previous term by an

ellipse about its major axis, a flat spheroid by the revolution of an ellipse about its minor axis.

In the remainder of our preface Archimedes gives a number of definitions connected with those solids. They are of importance in studying the development of Greek mathematical terminology.

ὑπερέχοντα, ἥ δὲ ἂ ὑπεροχὰ ἴσα τῷ ἐλαχίστῳ, καὶ ἄλλα μεγέθη τῷ μὲν πλήθει ἴσα τούτοις, τῷ δὲ μεγέθει ἕκαστον ἴσον τῷ μεγίστῳ, πάντα τὰ μεγέθη, ὧν ἐστὶν ἕκαστον ἴσον τῷ μεγίστῳ, πάντων μὲν τῶν τῷ ἴσῳ ὑπερεχόντων ἐλάσσονα ἐσσοῦνται ἢ διπλάσια, τῶν δὲ λοιπῶν χωρὶς τοῦ μεγίστου μείζονα ἢ διπλάσια. ἂ δὲ ἀπόδειξις τούτου φανερά.

Ibid., Prop. 1, Archim. ed. Heiberg i. 260. 26–261. 22

Εἴ κα μεγέθη ὅποσαοῦν τῷ πλήθει ἄλλοις μεγέθεσιν ἴσοις τῷ πλήθει κατὰ δύο τὸν αὐτὸν λόγον ἔχωντι τὰ ὁμοίως τεταγμένα, λέγεται δὲ τὰ τε πρῶτα μεγέθη ποτ' ἄλλα μεγέθη ἢ πάντα ἢ τινα αὐτῶν ἐν λόγοις ὁποιοιοῦν, καὶ τὰ ὕστερον ποτ' ἄλλα μεγέθη τὰ ὁμόλογα ἐν τοῖς αὐτοῖς λόγοις, πάντα τὰ πρῶτα μεγέθη ποτὶ πάντα, ἃ λέγονται, τὸν αὐτὸν ἐξοῦντι λόγον, ὃν ἔχοντι πάντα τὰ ὕστερον μεγέθη ποτὶ πάντα, ἃ λέγονται.

Ἔστω τινὰ μεγέθη τὰ Α, Β, Γ, Δ, Ε, Ζ ἄλλοις μεγέθεσιν ἴσοις τῷ πλήθει τοῖς, Η, Θ, Ι, Κ, Λ, Μ

* If h is the common difference, the first series is $h, 2h, 3h, \dots, nh$, and the second series is nh, nh, \dots to n terms, its sum obviously being n^2h . The lemma asserts that

$$2(h+2h+3h+\dots+n-1h) < n^2h < 2(h+2h+3h+\dots+nh).$$

It is proved in the book *On Spirals*, Prop. 11. The proof is geometrical, lines being placed side by side to represent the

ARCHIMEDES

equal quantity, which common difference is equal to the least term, and if there be a second series of magnitudes, equal to the first in number, in which each term is equal to the greatest term [in the first series], the sum of the magnitudes in the series in which each term is equal to the greatest term is less than double of the sum of the magnitudes differing by an equal quantity, but greater than double of the sum of those magnitudes, less the greatest term. The proof of this is clear.^a

Ibid., Prop. 1, Archim. ed. Heiberg i. 260. 26-261. 22

If there be a series of magnitudes, as many as you please, and it be equal in number to another series of magnitudes, and the terms have the same ratio two by two, and if any or all of the first series of magnitudes form any proportion with another series of magnitudes, and if the second series of magnitudes form the same proportion with the corresponding terms of another series of magnitudes, the sum of the first series of magnitudes bears to the sum of those with which they are in proportion the same ratio as the sum of the second series of magnitudes bears to the sums of the terms with which they are in proportion.

Let the series of magnitudes A, B, Γ, Δ, E, Z be equal in number to the series of magnitudes H, Θ, I,

terms of the arithmetical progression and produced until each is equal to the greatest term. It is equivalent to this algebraical proof:

Let $S_n = h + 2h + 3h + \dots + nh.$

Then $S_n = nh + (n-1)h + (n-2)h + \dots + h.$

Adding, $2S_n = n(n+1)h,$

and so $2S_{n-1} = (n-1)nh.$

Therefore $2S_{n-1} < n^2h < 2S_n.$

GREEK MATHEMATICS

κατὰ δύο τὸν αὐτὸν ἔχοντα λόγον, καὶ ἐχέτω τὸ μὲν Α ποτὶ τὸ Β τὸν αὐτὸν λόγον, ὃν τὸ Η ποτὶ τὸ Θ, τὸ δὲ Β ποτὶ τὸ Γ, ὃν τὸ Θ ποτὶ τὸ Ι, καὶ τὰ ἄλλα ὁμοίως τούτοις, λεγέσθω δὲ τὰ μὲν Α, Β, Γ, Δ, Ε, Ζ μεγέθεα ποτ' ἄλλα μεγέθεα τὰ Ν, Ξ, Ο, Π, Ρ, Σ ἐν λόγοις ὁποιοισοῦν, τὰ δὲ Η, Θ, Ι, Κ, Λ, Μ ποτ' ἄλλα τὰ Τ, Υ, Φ, Χ, Ψ, Ω, τὰ ὁμόλογα ἐν τοῖς αὐτοῖς λόγοις, καὶ ὃν μὲν ἔχει λόγον τὸ Α ποτὶ τὸ Ν, τὸ Η ἐχέτω ποτὶ τὸ Τ, ὃν δὲ λόγον ἔχει τὸ Β ποτὶ τὸ Ξ, τὸ Θ ἐχέτω ποτὶ τὸ Υ, καὶ τὰ ἄλλα ὁμοίως τούτοις· δευκτέον, ὅτι πάντα τὰ Α, Β, Γ, Δ, Ε, Ζ ποτὶ πάντα τὰ Ν, Ξ, Ο, Π, Ρ, Σ τὸν αὐτὸν ἔχοντι λόγον, ὃν πάντα τὰ Η, Θ, Ι, Κ, Λ, Μ ποτὶ πάντα τὰ Τ, Υ, Φ, Χ, Ψ, Ω.

^a Since	$N : A = T : H, A : B = H : \Theta,$	[<i>ex hyp.</i>]
∴ <i>ex aequo</i>	$N : B = T : \Theta.$	[Eucl. v. 22]
But	$B : \Xi = \Theta : \Upsilon;$	[<i>ex hyp.</i>]
∴ <i>ex aequo</i>	$N : \Xi = T : \Upsilon.$	[Eucl. v. 22]
Similarly		
	$\Xi : O = \Upsilon : \Phi, O : \Pi = \Phi : X, \Pi : P = X : \Psi, P : \Sigma = \Psi : \Omega.$	
Now since	$A : B = H : \Theta,$	[<i>ex hyp.</i>]
∴ <i>componendo</i>	$A + B : A = H + \Theta : H,$	[Eucl. v. 18]
<i>i.e., permutando</i>	$A + B : H + \Theta = A : H.$	[Eucl. v. 16]
But since	$N : A = T : H,$	[<i>ex hyp.</i>]
∴	$A : H = N : T$	[Eucl. v. 16]
	$= \Xi : \Upsilon$	[<i>ibid.</i>]
	$= O : \Phi$	[<i>ibid.</i>]
	$= \Gamma : I.$	[<i>ibid.</i>]
∴	$A + B : H + \Theta = \Gamma : I.$	
∴	$A + B + \Gamma : H + \Theta + I = \Gamma : I$	[Eucl. v. 18]
	$= O : \Phi$	[Eucl. v. 16]

ARCHIMEDES

K, Λ , M, and let them have the same ratio two by two, so that

$$A : B = H : \Theta, B : \Gamma = \Theta : I,$$

and so on, and let the series of magnitudes A, B, Γ , Δ , E, Z form any proportion with another series of magnitudes N, Ξ , O, Π , P, Σ , and let H, Θ , I, K, Λ , M form the same proportion with the corresponding terms of another series, T, Y, Φ , X, Ψ , Ω so that

$$A : N = H : T, B : \Xi = \Theta : Y,$$

and so on ; it is required to prove that

$$\frac{A + B + \Gamma + \Delta + E + Z}{N + \Xi + O + \Pi + P + \Sigma} = \frac{H + \Theta + I + K + \Lambda + M}{T + Y + \Phi + X + \Psi + \Omega} \alpha$$

$$= \Pi : X \quad [\textit{ibid.}]$$

$$= \Delta : K. \quad [\textit{ibid.}]$$

By pursuing this method it may be proved that

$$A + B + \Gamma + \Delta + E + Z : H + \Theta + I + K + \Lambda + M = A : H,$$

or, *permutando*,

$$A + B + \Gamma + \Delta + E + Z : A = H + \Theta + I + K + \Lambda + M : H. \quad (1)$$

Now

$$N : \Xi = T : Y;$$

\therefore *componendo et permutando*,

$$N + \Xi : T + Y = \Xi : Y \quad [\text{Eucl. v. 18, v. 16}]$$

$$= O : \Phi; \quad [\text{Eucl. v. 16}]$$

$$\text{whence } N + \Xi + O : T + Y + \Phi = O : \Phi, \quad [\text{Eucl. v. 18}]$$

and so on until we obtain

$$N + \Xi + O + \Pi + P + \Sigma : T + Y + \Phi + X + \Psi + \Omega = N : T. \quad (2)$$

But

$$A : N = H : T; \quad [\textit{ex hyp.}]$$

\therefore by (1) and (2),

$$\frac{A + B + \Gamma + \Delta + E + Z}{N + \Xi + O + \Pi + P + \Sigma} = \frac{H + \Theta + I + K + \Lambda + M}{T + Y + \Phi + X + \Psi + \Omega}$$

ARCHIMEDES

(iii.) *Volume of a Segment of a Paraboloid of Revolution*

Ibid., Prop. 21, Archim. ed. Heiberg i. 344. 21-354. 20

Any segment of a right-angled conoid cut off by a plane perpendicular to the axis is one-and-a-half times the cone having the same base as the segment and the same axis.

For let there be a segment of a right-angled conoid cut off by a plane perpendicular to the axis, and let it be cut by another plane through the axis, and let the section be the section of a right-angled cone $AB\Gamma$,^a and let ΓA be a straight line in the plane cutting off the segment, and let $B\Delta$ be the axis of the segment, and let there be a cone, with vertex B , having the same base and the same axis as the segment. It is required to prove that the segment of the conoid is one-and-a-half times this cone.

For let there be set out a cone Ψ one-and-a-half times as great as the cone with base about the diameter $A\Gamma$ and with axis $B\Delta$, and let there be a

^a It is proved in Prop. 11 that the section will be a parabola.

τὸν κύκλον τὸν περὶ διάμετρον τὰν ΑΓ, ἄξονα δὲ τὰν ΒΔ· ἐσσεῖται οὖν ὁ Ψ' κῶνος ἡμίσεος τοῦ κυλίνδρου [ἐπεὶπερ ἡμιόλιός ἐστιν ὁ Ψ' κῶνος τοῦ αὐτοῦ κώνου].¹ λέγω, ὅτι τὸ τμᾶμα τοῦ κωνοειδέος ἴσον ἐστὶ τῷ Ψ' κώνῳ.

Εἰ γὰρ μή ἐστιν ἴσον, ἦτοι μεῖζόν ἐντι ἢ ἔλασσον. ἔστω δὴ πρότερον, εἰ δυνατόν, μεῖζον. ἐγγεγράφθω δὴ σχῆμα στερεὸν εἰς τὸ τμᾶμα, καὶ ἄλλο περιγεγράφθω ἐκ κυλίνδρων ὕψος ἴσον ἐχόντων συγκείμενον, ὥστε τὸ περιγραφέν σχῆμα τοῦ ἐγγραφέντος ὑπερέχειν ἐλάσσονι, ἢ ἀλίκῳ ὑπερέχει τὸ τοῦ κωνοειδέος τμᾶμα τοῦ Ψ' κώνου, καὶ ἔστω τῶν κυλίνδρων, ἐξ ὧν σύγκειται τὸ περιγραφέν σχῆμα, μέγιστος μὲν ὁ βάσιν ἔχων τὸν κύκλον τὸν περὶ διάμετρον τὰν ΑΓ, ἄξονα δὲ τὰν ΕΔ, ἐλάχιστος δὲ ὁ βάσιν μὲν ἔχων τὸν κύκλον τὸν περὶ διάμετρον τὰν ΣΤ, ἄξονα δὲ τὰν ΒΙ, τῶν δὲ κυλίνδρων, ἐξ ὧν σύγκειται τὸ ἐγγραφέν σχῆμα, μέγιστος μὲν ἔστω ὁ βάσιν ἔχων τὸν κύκλον τὸν περὶ διάμετρον τὰν ΚΛ, ἄξονα δὲ τὰν ΔΕ, ἐλάχιστος δὲ ὁ βάσιν μὲν ἔχων τὸν κύκλον τὸν περὶ διάμετρον τὰν ΣΤ, ἄξονα δὲ τὰν ΘΙ, ἐκβεβλήσθω δὲ τὰ ἐπίπεδα πάντων τῶν κυλίνδρων ποτὶ τὰν

^a For the cylinder is three times; and the cone Ψ' one-and-a-
172

ARCHIMEDES

cylinder having for its base the circle about the diameter AF and for its axis BA ; then the cone Ψ is one-half of the cylinder^a; I say that the segment of the conoid is equal to the cone Ψ .

If it be not equal, it is either greater or less. Let it first be, if possible, greater. Then let there be inscribed in the segment a solid figure and let there be circumscribed another solid figure made up of cylinders having an equal altitude,^b in such a way that the circumscribed figure exceeds the inscribed figure by a quantity less than that by which the segment of the conoid exceeds the cone Ψ [Prop. 19]; and let the greatest of the cylinders composing the circumscribed figure be that having for its base the circle about the diameter AF and for axis EA , and let the least be that having for its base the circle about the diameter ST and for axis BI ; and let the greatest of the cylinders composing the inscribed figure be that having for its base the circle about the diameter KA and for axis AE , and let the least be that having for its base the circle about the diameter ST' and for axis OI ; and let the planes of all the cylinders be

half times, as great as the same cone; but because *τοῦ αὐτοῦ κώνου* is obscure and *ἐπείτερ* often introduces an interpolation, Heiberg rejects the explanation to this effect in the text.

^b Archimedes has used those inscribed and circumscribed figures in previous propositions. The paraboloid is generated by the revolution of the parabola ABF about its axis BA . Chords $KA \dots ST$ are drawn in the parabola at right angles to the axis and at equal intervals from each other. From the points where they meet the parabola, perpendiculars are drawn to the next chords. In this way there are built up inside and outside the parabola "staggered" figures consisting of decreasing rectangles. When the parabola revolves, the rectangles become cylinders, and the segment of the paraboloid lies between a set of cylinders and the circumscribed set of cylinders.

ἐπιφάνειαν τοῦ κυλίνδρου τοῦ βάσιν ἔχοντος τὸν κύκλον τὸν περὶ διάμετρον τὰν ΑΓ, ἄξονα δὲ τὰν ΒΔ· ἐσσεῖται δὴ ὁ ὅλος κύλινδρος διηρημένος εἰς κυλίνδρους τῷ μὲν πλήθει ἴσους τοῖς κυλίνδροις τοῖς ἐν τῷ περιγεγραμμένῳ σχήματι, τῷ δὲ μεγέθει ἴσους τῷ μεγίστῳ αὐτῶν. καὶ ἐπεὶ τὸ περιγεγραμμένον σχῆμα περὶ τὸ τμᾶμα ἐλάσσονι ὑπερέχει τοῦ ἐγγεγραμμένου σχήματος ἢ τὸ τμᾶμα τοῦ κώνου, δῆλον, ὅτι καὶ τὸ ἐγγεγραμμένον σχῆμα ἐν τῷ τμᾶματι μείζον ἐστὶ τοῦ Ψ κώνου. ὁ δὴ πρῶτος κύλινδρος τῶν ἐν τῷ ὅλῳ κυλίνδρῳ ὁ ἔχων ἄξονα τὰν ΔΕ ποτὶ τὸν πρῶτον κύλινδρον τῶν ἐν τῷ ἐγγεγραμμένῳ σχήματι τὸν ἔχοντα ἄξονα τὰν ΔΕ τὸν αὐτὸν ἔχει λόγον, ὃν ἂ ΔΑ ποτὶ τὰν ΚΕ δυνάμει· οὗτος δὲ ἐστὶν ὁ αὐτὸς τῷ, ὃν ἔχει ἂ ΒΔ ποτὶ τὰν ΒΕ, καὶ τῷ, ὃν ἔχει ἂ ΔΑ ποτὶ τὰν ΕΞ. ὁμοίως δὲ δειχθήσεται καὶ ὁ δεύτερος κύλινδρος τῶν ἐν τῷ ὅλῳ κυλίνδρῳ ὁ ἔχων ἄξονα τὸν ΕΖ ποτὶ τὸν δεύτερον κύλινδρον τῶν ἐν τῷ ἐγγεγραμμένῳ σχήματι τὸν αὐτὸν ἔχειν λόγον, ὃν ἂ ΠΕ, τουτέστιν ἂ ΔΑ, ποτὶ τὰν ΖΟ, καὶ τῶν ἄλλων κυλίνδρων ἕκαστος τῶν ἐν τῷ ὅλῳ κυλίνδρῳ ἄξονα ἔχόντων ἴσον τῷ ΔΕ ποτὶ ἕκαστον τῶν κυλίνδρων τῶν ἐν τῷ ἐγγεγραμμένῳ σχήματι ἄξονα ἔχόντων τὸν αὐτὸν ἔξει τοῦτον τὸν λόγον, ὃν ἂ ἡμίσεια τῆς διαμέτρου τῆς βάσεως αὐτοῦ ποτὶ τὰν ἀπολελαμμένην ἀπ' αὐτῆς μεταξὺ τὰν ΑΒ, ΒΔ εὐθειῶν· καὶ πάντες οὖν οἱ κυλίνδροι οἱ ἐν τῷ κυλίνδρῳ, οὗ βάσις μὲν ἐστὶν ὁ κύκλος ὁ περὶ διάμετρον τὰν ΑΓ, ἄξων δὲ [ἐστὶν]¹ ἂ ΔΙ εὐθεῖα, ποτὶ πάντας τοὺς κυλίνδρους τοὺς ἐν τῷ ἐγγεγραμμένῳ σχήματι τὸν αὐτὸν ἐξοῦντι λόγον, ὃν

ARCHIMEDES

produced to the surface of the cylinder having for its base the circle about the diameter AF and for axis BD ; then the whole cylinder is divided into cylinders equal in number to the cylinders in the circumscribed figure and in magnitude equal to the greatest of them. And since the figure circumscribed about the segment exceeds the inscribed figure by a quantity less than that by which the segment exceeds the cone, it is clear that the figure inscribed in the segment is greater than the cone Ψ .^a Now the first cylinder of those in the whole cylinder, that having ΔE for its axis, bears to the first cylinder in the inscribed figure, which also has ΔE for its axis, the ratio $\Delta A^2 : KE^2$ [Eucl. xii. 11 and xii. 2]; but $\Delta A^2 : KE^2 = BD : BE^b = \Delta A : EZ$. Similarly it may be proved that the second cylinder of those in the whole cylinder, that having EZ for its axis, bears to the second cylinder in the inscribed figure the ratio $\Pi E : ZO$, that is, $\Delta A : ZO$, and each of the other cylinders in the whole cylinder, having its axis equal to ΔE , bears to each of the cylinders in the inscribed figure, having the same axis in order, the same ratio as half the diameter of the base bears to the part cut off between the straight lines AB, BD ; and therefore the sum of the cylinders in the cylinder having for its base the circle about the diameter AF and for axis the straight line ΔI bears to the sum of the cylinders in the inscribed figure the same ratio as the sum of

^a Because the circumscribed figure is greater than the segment.

^b By the property of the parabola; v. *Quadr. parab.* 3.

	Second cylinder in inscribed figure	= ΖΟ,

and so on.

$$\therefore \frac{\text{Whole cylinder}}{\text{Inscribed figure}} = \frac{\Delta A + \text{ΕΠ} + \dots}{\text{ΕΞ} + \text{ΖΟ} + \dots}$$

ARCHIMEDES

the radii of the circles, which are the bases of the aforesaid cylinders, bears to the sum of the straight lines cut off from them between AB , $B\Delta$.^a But the sum of the aforesaid straight lines is greater than double of the aforesaid straight lines without $\Delta\Delta^b$; so that the sum of the cylinders in the cylinder whose axis is ΔI is greater than double of the inscribed figure; therefore the whole cylinder, whose axis is ΔB , is greater by far than double of the inscribed figure. But it was double of the cone Ψ ; therefore the inscribed figure is less than the cone Ψ ; which is impossible, for it was proved to be greater. Therefore the conoid is not greater than the cone Ψ .

Similarly [it can be shown] not to be less; for let the figure be again inscribed and another circumscribed so that the excess is less than that by which the cone Ψ exceeds the conoid, and let the rest of the construction be as before. Then because the inscribed figure is less than the segment, and the inscribed figure is less than the circumscribed by some quantity less than the difference between the segment and the cone Ψ , it is clear that the circumscribed figure is less than the cone Ψ . Again, the first

This follows from Prop. 1, for

$$\frac{\text{First cylinder in cylinder}}{\text{Second cylinder in cylinder}} = 1 = \frac{\Delta A}{E\Gamma},$$

and so on, and thus the other condition of the theorem is satisfied.

^b For ΔA , $E\Gamma$, $ZO \dots$ is a series diminishing in arithmetical progression, and ΔA , $E\Gamma \dots$ is a series, equal in number, in which each term is equal to the greatest in the arithmetical progression. Therefore, by the Lemma to Prop. 1,

$$\Delta A + E\Gamma + \dots > 2(E\Gamma + ZO + \dots).$$

πρῶτος κύλινδρος τῶν ἐν τῷ ὅλῳ κυλίνδρῳ ὁ ἔχων ἄξονα τὰν ΔΕ ποτὶ τὸν πρῶτον κύλινδρον τῶν ἐν τῷ περιγεγραμμένῳ σχήματι τὸν τὸν αὐτὸν ἔχοντα ἄξονα τὰν ΕΔ τὸν αὐτὸν ἔχει λόγον, ὃν τὸ ἀπὸ τᾶς ΑΔ τετράγωνον ποτὶ τὸ αὐτό, ὁ δὲ δεύτερος κύλινδρος τῶν ἐν τῷ ὅλῳ κυλίνδρῳ ὁ ἔχων ἄξονα τὰν ΕΖ ποτὶ τὸν δεύτερον κύλινδρον τῶν ἐν τῷ περιγεγραμμένῳ σχήματι τὸν ἔχοντα ἄξονα τὰν ΕΖ τὸν αὐτὸν ἔχει λόγον, ὃν ἡ ΔΑ ποτὶ τὰν ΚΕ δυνάμει· οὗτος δὲ ἐστὶν ὁ αὐτὸς τῷ, ὃν ἔχει ἡ ΒΔ ποτὶ τὰν ΒΕ, καὶ τῷ, ὃν ἔχει ἡ ΔΑ ποτὶ τὰν ΕΞ· καὶ τῶν ἄλλων κυλίνδρων ἕκαστος τῶν ἐν τῷ ὅλῳ κυλίνδρῳ ἄξονα ἐχόντων ἴσον τῇ ΔΕ ποτὶ ἕκαστον τῶν κυλίνδρων τῶν ἐν τῷ περιγεγραμμένῳ σχήματι ἄξονα ἐχόντων τὸν αὐτόν, ἔξει τοῦτον τὸν λόγον, ὃν ἡ ἡμίσεια τᾶς διαμέτρου τᾶς βάσιος αὐτοῦ ποτὶ τὰν ἀπολελαμμέναν ἀπ' αὐτᾶς μεταξὺ τᾶν ΑΒ, ΒΔ εὐθειᾶν· καὶ πάντες οὖν οἱ κύλινδροι οἱ ἐν τῷ ὅλῳ κυλίνδρῳ, οὓς ἄξων ἐστὶν ἡ ΒΔ εὐθεῖα, ποτὶ πάντας τοὺς κυλίνδρους τοὺς ἐν τῷ περιγεγραμμένῳ σχήματι τὸν αὐτὸν ἐξοῦντι λόγον, ὃν πᾶσαι αἱ εὐθεῖαι ποτὶ πάσας τὰς εὐθείας. αἱ δὲ εὐθεῖαι πᾶσαι αἱ ἐκ τῶν κέντρων τῶν κύκλων, οἱ βάσιές ἐντι τῶν κυλίνδρων, τᾶν εὐθειᾶν πασᾶν τῶν ἀπολελαμμενᾶν ἀπ' αὐτᾶν σὺν τῇ ΑΔ ἐλάσσονές ἐντι

* As before,

First cylinder in whole cylinder $\frac{\Delta\Delta}{\Delta\Delta}$

First cylinder in circumscribed figure $= \frac{\Delta\Delta}{\Delta\Delta}$

Second cylinder in whole cylinder $\frac{\Delta\Delta}{\text{ΕΠ}}$

Second cylinder in circumscribed figure $= \frac{\Delta\Delta}{\text{ΕΞ}} = \frac{\text{ΕΠ}}{\text{ΕΞ}}$

and so on.

ARCHIMEDES

cylinder of those in the whole cylinder, having ΔE for its axis, bears to the first cylinder of those in the circumscribed figure, having the same axis $E\Delta$, the ratio $\Delta A^2 : A\Delta^2$; the second cylinder in the whole cylinder, having EZ for its axis, bears to the second cylinder in the circumscribed figure, having EZ also for its axis, the ratio $\Delta A^2 : KE^2$; this is the same as $B\Delta : BE$, and this is the same as $\Delta A : E\Xi$; and each of the other cylinders in the whole cylinder, having its axis equal to ΔE , will bear to the corresponding cylinder in the circumscribed figure, having the same axis, the same ratio as half the diameter of the base bears to the portion cut off from it between the straight lines AB , $B\Delta$; and therefore the sum of the cylinders in the whole cylinder, whose axis is the straight line $B\Delta$, bears to the sum of the cylinders in the circumscribed figure the same ratio as the sum of the one set of straight lines bears to the sum of the other set of straight lines.^a But the sum of the radii of the circles which are the bases of the cylinders is less than double of the sum of the straight lines cut off from them together with $A\Delta$ ^b; it is therefore clear

And

$$\frac{\text{First cylinder in whole cylinder}}{\text{Second cylinder in whole cylinder}} = 1 = \frac{\Delta A}{E\Xi},$$

and so on.

Therefore the conditions of Prop. 1 are satisfied and

$$\frac{\text{Whole cylinder}}{\text{Circumscribed figure}} = \frac{\Delta A + E\Xi + \dots}{\Delta A + E\Xi + \dots}.$$

^b As before, ΔA , $E\Xi \dots$ is a series diminishing in arithmetical progression, and ΔA , $E\Xi \dots$ is a series, equal in number, in which each term is equal to the greatest in the arithmetical progression.

Therefore, by the Lemma to Prop. 1,

$$\Delta A + E\Xi + \dots < 2(\Delta A + E\Xi + \dots).$$

^a Archimedes' proof may be shown to be equivalent to an integration, as Heath has done (*The Works of Archimedes*, cxlvii-cxlviii).

For, if n be the number of cylinders in the whole cylinder, and $\Delta\Delta = nh$, Archimedes has shown that

$$\begin{array}{lcl} \text{Whole cylinder} & & \\ \text{Inscribed figure} & = & \frac{n^2 h}{h + 2h + 3h + \dots + (n-1)h} \\ & > 2, & \text{[Lemma to Prop. 1]} \end{array}$$

and

$$\begin{array}{lcl} \text{Whole cylinder} & & \\ \text{Circumscribed figure} & = & \frac{n^2 h}{n + 2h + 3h + \dots + nh} \\ & < 2. & \text{[ibid.]} \end{array}$$

In Props. 19 and 20 he has meanwhile shown that, by increasing n sufficiently, the inscribed and circumscribed figures can be made to differ by less than any assigned volume.

ARCHIMEDES

that the sum of all the cylinders in the whole cylinder is less than double of the cylinders in the circumscribed figure ; therefore the cylinder having for its base the circle about the diameter $A\Gamma$ and for axis $B\Delta$ is less than double of the circumscribed figure. But it is not, for it is greater than double ; for it is double of the cone Ψ , and the circumscribed figure was proved to be less than the cone Ψ . Therefore the segment of the conoid is not less than the cone Ψ . But it was proved not to be greater ; therefore it is one-and-a-half times the cone having the same base as the segment and the same axis.^a

When n is increased, h is diminished, but their product remains constant ; let $nh=c$.

Then the proof is equivalent to an assertion that, when n is indefinitely increased,

limit of $h[h+2h+3h+\dots+(n-1)h]=\frac{1}{2}c^2$,

which, in the notation of the integral calculus reads,

$$\int_0^c x dx = \frac{1}{2}c^2.$$

If the paraboloid is formed by the revolution of the parabola $y^2=ax$ about its axis, we should express the volume of a segment as

$$\int_0^a \pi y^2 dx,$$

or

$$\pi a \int_0^a x dx.$$

The constant does not appear in Archimedes' proof because he merely compares the volume of the segment with the cone, and does not give its absolute value. But his method is seen to be equivalent to a genuine integration.

As in other cases, Archimedes refrains from the final step of making the divisions in his circumscribed and inscribed figures indefinitely large ; he proceeds by the orthodox method of *reductio ad absurdum*.

Τῶν αὐτῶν δεδομένων καὶ τῆς ἐν τῷ κύκλῳ
εὐθείας ἐκβεβλημένης δυνατόν ἐστὶν ἀπὸ τοῦ

ARCHIMEDES

Θ moves uniformly round the circumference ΘKH of the circle while the point A , which moves along the straight line, traverses the line $A\Theta$; the point Θ which moves round the circumference of the circle traverses the arc ΘKZ while A traverses the straight line AE ; and furthermore the point A traverses the line $A\Delta$ in the same time as Θ traverses the arc ΘKH , each moving uniformly; it is clear, therefore, that $AE : A\Delta = \text{arc } \Theta KZ : \text{arc } \Theta KH$ [Prop. 2].

Similarly it may be shown that if one of the straight lines be drawn to the extremity of the spiral the same conclusion follows.^a

(iii.) *A Verging*^b

Ibid., Prop. 7, Archim. ed. Heiberg ii. 22. 14–24. 7

With the same data and the chord in the circle produced,^c it is possible to draw a line from the centre to meet

^a In Prop. 15 Archimedes shows (using different letters, however) that if AE , $A\Delta$ are drawn to meet the *second* turn of the spiral, while AZ , AH are drawn, as before, to meet the circumference of the *first* circle, then

$$AE : A\Delta = \text{arc } \Theta KZ + \text{circumference of first circle} : \text{arc } \Theta KH + \text{circumference of first circle},$$

and so on for higher turns.

In general, if E , Δ lie on the n th turn of the spiral, and the circumference of the first circle is c , then

$$AE : A\Delta = \text{arc } \Theta KZ + \overline{n - 1c} : \text{arc } \Theta KH + \overline{n - 1c}.$$

These theorems correspond to the equation of the curve $r = a\theta$ in polar co-ordinates.

^b This theorem is essential to the one that follows.

^c See n. a on this page.

* ΔΓ is a chord in a circle of centre K, and BN is the diameter drawn parallel to ΔΓ and produced. From K, ΚΘ is drawn perpendicular to ΔΓ, and ΚΛ is drawn perpendicular to ΚΓ so as to meet the diameter in Λ. Archimedes asserts that it is possible to draw ΚΕ to meet the circle in Ι and ΔΓ produced in Η so that ΒΗ : ΙΓ = Ζ : Η, an assigned ratio, provided that Ζ : Η < ΚΓ : ΘΚ. The straight line ΓΙ meets ΒΛ in Ν. In Prop. 5 Archimedes has proved a similar proposition when ΔΓ is a tangent, and in Prop. 6 he has proved the proposition for the case where the positions of Ι, Γ are reversed.

^b For triangle ΓΙΕ is similar to triangle ΚΙΝ, and therefore ΚΙ : ΙΝ = ΕΙ : ΙΓ [Eucl. vi. 4] ; and ΚΙ = ΚΓ.

^c The type of problem known as *νεύσεις*, *vergings*, has already been encountered (vol. i. p. 214 n. α). In this proposition, as in Props. 5 and 6, Archimedes gives no hint how

ARCHIMEDES

the produced chord so that the distance between the circumference and the produced chord shall bear to the distance between the extremity of the line intercepted [by the circle] and the extremity of the produced chord an assigned ratio, provided that the given ratio is greater than that which half of the given chord in the circle bears to the perpendicular drawn to it from the centre.

H —————

⁹Z' —————

Let the same things be given,^a and let the chord in the circle be produced, and let the given ratio be $Z : H$, and let it be greater than $\Gamma\Theta : \Theta K$; therefore it will be greater than $K\Gamma : \Gamma A$ [Eucl. vi. 4]. Then $Z : H$ is equal to the ratio of $K\Gamma$ to some line less than ΓA [Eucl. v. 10]. Let it be to IN verging upon Γ —for it is possible to make such an intercept—and IN will fall within ΓA , since it is less than ΓA . Then since $K\Gamma : IN = Z : H$,
therefore^b $EI : I\Gamma = Z : H$.^c

the construction is to be accomplished, though he was presumably familiar with a solution.

In the figure of the text, let T be the foot of the perpen-

dicular from I' to BA, and let Δ be the other extremity of the diameter through B. Let the unknown length KN= x , let I'T= a , KT= b , BΔ= $2c$, and let IN= k , a given length.

Then

$$NI \cdot NF = NA \cdot NB,$$

i.e.,

$$k\sqrt{a^2 + (x-b)^2} = (x-c)(x+c),$$

which, after rationalization, is an equation of the fourth degree in x .

Alternatively, if we denote NF by y , we can determine x and y by the two equations

$$\begin{aligned} y^2 &= a^2 + (x-b)^2, \\ ky &= x^2 - c^2, \end{aligned}$$

ARCHIMEDES

(iv.) *Property of the Subtangent*

Ibid., Prop. 20, Archim. ed. Heiberg ii. 72. 4-74. 26

If a straight line touch the first turn of the spiral other than at the extremity of the spiral, and from the point of contact a straight line be drawn to the origin, and with the origin as centre and this connecting line as radius a circle be drawn, and from the origin a straight line be drawn at right angles to the straight line joining the point of contact to the origin, it will meet the tangent, and the straight line between the point of meeting and the origin will be equal to the arc of the circle between the point of contact and the point in which the circle cuts the initial line, the arc being measured in the forward direction from the point on the initial line.

Let $AB\Gamma\Delta$ lie on the first turn of a spiral, and let

the straight line EZ touch it at Δ , and from Δ let $\Lambda\Delta$

so that values of x and y satisfying the conditions of the problem are given by the points of intersection of a certain parabola and a certain hyperbola.

The whole question of *vergings*, including this problem, is admirably discussed by Heath, *The Works of Archimedes*, c-cxxii.

ἀρχὰν τῆς ἑλικος ἐπεζεύχθω ἡ $\Lambda\Delta$, καὶ κέντρῳ μὲν τῷ A , διαστήματι δὲ τῷ $\Lambda\Delta$ κύκλος γεγράφθω ὁ ΔMN , τεμνέτω δ' οὗτος τὰν ἀρχὰν τῆς περιφορᾶς κατὰ τὸ K , ἄχθω δὲ ἡ ZA ποτὶ τὰν $\Lambda\Delta$ ὀρθά. ὅτι μὲν οὖν αὐτὰ συμπίπτει, δῆλον· ὅτι δὲ καὶ ἴσα ἐστὶν ἡ ZA εὐθεῖα τῇ $KMN\Delta$ περιφερείᾳ, δεικτέον.

Εἰ γὰρ μή, ἦτοι μείζων ἐστὶν ἢ ἐλάσσων. ἔστω, εἰ δυνατόν, πρότερον μείζων, λελάφθω δὲ τις ἡ ΛA τῆς μὲν ZA εὐθείας ἐλάσσων, τῆς δὲ $KMN\Delta$ περιφερείας μείζων. πάλιν δὲ κύκλος ἐστὶν ὁ KMN καὶ ἐν τῷ κύκλῳ γραμμὰ ἐλάσσων τῆς διαμέτρου ἡ ΔN καὶ λόγος, ὃν ἔχει ἡ ΔA ποτὶ $\Lambda\Delta$, μείζων τοῦ, ὃν ἔχει ἡ ἡμίσεια τῆς ΔN ποτὶ τὰν ἀπὸ τοῦ A κάθετον ἐπ' αὐτὰν ἀγμέναν· δυνατόν οὖν ἐστὶν ἀπὸ τοῦ A ποτιβαλεῖν τὰν AE ποτὶ τὰν $N\Delta$ ἐκβεβλημέναν, ὥστε τὰν EP ποτὶ τὰν ΔP τὸν αὐτὸν ἔχειν λόγον, ὃν ἡ ΔA ποτὶ τὰν $\Lambda\Delta$. δέδεικται γὰρ τοῦτο δυνατόν εἶναι· ἔξει οὖν καὶ ἡ EP ποτὶ τὰν AP τὸν αὐτὸν λόγον, ὃν ἡ ΔP ποτὶ τὰν $\Lambda\Delta$. ἡ δὲ ΔP ποτὶ τὰν $\Lambda\Delta$ ἐλάσσονα λόγον ἔχει ἢ ἡ ΔP περιφέρεια ποτὶ τὰν $KM\Delta$ περιφέρειαν, ἐπεὶ ἡ μὲν ΔP ἐλάσσων ἐστὶ τῆς ΔP περιφερείας, ἡ δὲ $\Lambda\Delta$ μείζων τῆς $KM\Delta$ περιφερείας· ἐλάσσονα οὖν λόγον ἔχει ἡ EP εὐθεῖα ποτὶ PA ἢ ἡ ΔP περιφέρεια ποτὶ τὰν $KM\Delta$ περιφέρειαν· ὥστε καὶ ἡ AE ποτὶ AP ἐλάσσονα λόγον ἔχει ἢ ἡ KMP περιφέρεια ποτὶ τὰν $KM\Delta$ περι-

* For in Prop. 16 the angle $\Lambda\Delta Z$ was shown to be acute.

† For ΔN touches the spiral and so can have no part within the spiral, and therefore cannot pass through A ; therefore it is a chord of the circle and less than the diameter.

‡ For, if a perpendicular be drawn from A to ΔN , it bisects

ARCHIMEDES

be drawn to the origin, and with centre A and radius $A\Delta$ let the circle ΔMN be described, and let this circle cut the initial line at K, and let ZA be drawn at right angles to $A\Delta$. That it will meet $[Z\Delta]$ is clear^a; it is required to prove that the straight line ZA is equal to the arc $KMN\Delta$.

If not, it is either greater or less. Let it first be, if possible, greater, and let ΔA be taken less than the straight line ZA, but greater than the arc $KMN\Delta$ [Prop. 4]. Again, KMN is a circle, and in this circle ΔN is a line less than the diameter,^b and the ratio $\Delta A : A\Delta$ is greater than the ratio of half ΔN to the perpendicular drawn to it from A^c; it is therefore possible to draw from A a straight line AE meeting $N\Delta$ produced in such a way that

$$EP : \Delta P = \Delta A : A\Delta ;$$

for this has been proved possible [Prop. 7]; therefore

$$EP : AP = \Delta P : A\Delta .^d$$

But $\Delta P : A\Delta < \text{arc } \Delta P : \text{arc } KM\Delta$,

since ΔP is less than the arc ΔP , and $A\Delta$ is greater than the arc $KM\Delta$;

$$\therefore EP : PA < \text{arc } \Delta P : \text{arc } KM\Delta ;$$

$$\therefore AE : AP < \text{arc } KMP : \text{arc } KM\Delta .$$

[Eucl. v. 18]

ΔN [Eucl. iii. 3] and divides triangle ΔAZ into two triangles of which one is similar to triangle ΔAZ [Eucl. vi. 8]; therefore

$$\Delta A : AZ = \frac{1}{2}N\Delta : (\text{perpendicular from A to } N\Delta).$$

[Eucl. vi. 4]

But $AZ > A\Delta$;

$$\therefore \Delta A : A\Delta > \frac{1}{2}N\Delta : (\text{perpendicular from A to } N\Delta).$$

^d For $\Delta A = AP$, being a radius of the same circle; and the proportion follows *permutando*.

GREEK MATHEMATICS

φέρειαν. ὃν δὲ λόγον ἔχει ἡ KMP ποτὶ τὰν $KMΔ$ περιφέρειαν, τοῦτον ἔχει ἡ XA ποτὶ AD . ἐλάσσονα ἄρα λόγον ἔχει ἡ EL ποτὶ AP ἢ ἡ AX ποτὶ DA . ὅπερ ἐστὶν ἀδύνατον. οὐκ ἄρα μείζων ἡ ZA τῆς $KMΔ$ περιφερείας. ὁμοίως δὲ τοῖς πρότερον δειχθήσεται, ὅτι οὐδὲ ἐλάσσων ἐστὶν ἴσα ἄρα.

(f) SEMI-REGULAR SOLIDS

Papp. *Coll.* v. 19, ed. Hultsch i. 352. 7-354. 10

Πολλὰ γὰρ ἐπινοῆσαι δυνατόν στερεὰ σχήματα παντοίας ἐπιφανείας ἔχοντα, μᾶλλον δ' ἂν τις ἀξιώσει λόγου τὰ τετάχθαι δοκοῦντα [καὶ τούτων πολὺ πλεον τοὺς τε κῶνους καὶ κυλίνδρους καὶ τὰ καλούμενα πολύεδρα].¹ ταῦτα δ' ἐστὶν οὐ μόνον τὰ παρὰ τῷ θειοτάτῳ Πλάτῳ πέντε σχήματα, τουτέστιν τετράεδρόν τε καὶ ἑξάεδρον, ὀκτάεδρόν τε καὶ δωδεκάεδρον, πέμπτον δ' εἰκοσάεδρον, ἀλλὰ καὶ τὰ ὑπὸ Ἀρχιμήδους εὗρεθέντα τρισκαίδεκα τὸν ἀριθμὸν ὑπὸ ἰσοπλεύρων μὲν καὶ ἰσογωνίων οὐχ ὁμοίων δὲ πολυγώνων περιεχόμενα.

¹ καὶ . . . πολύεδρα om. Hultsch.

* This part of the proof involves a *verging* assumed in Prop. 8, just as the earlier part assumed the *verging* of Prop. 7. The *verging* of Prop. 8 has already been described (vol. i. p. 350 n. b) in connexion with Pappus's comments on it.

^b Archimedes goes on to show that the theorem is true even if the tangent touches the spiral in its second or some higher turn, not at the extremity of the turn; and in Props. 18 and 19 he has shown that the theorem is true if the tangent should touch at an extremity of a turn.

ARCHIMEDES

Now $\text{arc } KMP : \text{arc } KM\Delta = XA : A\Delta$; [Prop. 14
 $\therefore EA : AP < AX : \Delta A$;

which is impossible. Therefore ZA is not greater than the arc $KM\Delta$. In the same way as above it may be shown to be not less^a; therefore it is equal.^b

(f) SEMI-REGULAR SOLIDS

Pappus, *Collection* v. 19, ed. Hultsch i. 352. 7-354. 10

Although many solid figures having all kinds of surfaces can be conceived, those which appear to be regularly formed are most deserving of attention. Those include not only the five figures found in the godlike Plato, that is, the tetrahedron and the cube, the octahedron and the dodecahedron, and fifthly the icosahedron,^c but also the solids, thirteen in number, which were discovered by Archimedes^d and are contained by equilateral and equiangular, but not similar, polygons.

As Pappus (ed. Hultsch 302. 14-18) notes, the theorem can be established without recourse to propositions involving *solid loci* (for the meaning of which see vol. i. pp. 348-349), and proofs involving only "plane" methods have been developed by Tannery, *Mémoires scientifiques*, i., 1912, pp. 300-316 and Heath, *H.G.M.* ii. 556-561. It must remain a puzzle why Archimedes chose his particular method of proof, especially as Heath's proof is suggested by the figures of Props. 6 and 9; Heath (*loc. cit.*, p. 557) says "it is scarcely possible to assign any reason except his definite predilection for the form of proof by *reductio ad absurdum* based ultimately on his famous 'Lemma' or Axiom."

^c For the five regular solids, see vol. i. pp. 216-225.

^d Heron (*Definitions* 104, ed. Heiberg 66. 1-9) asserts that two were known to Plato. One is that described as P_8 below, but the other, said to be bounded by eight squares and six triangles, is wrongly given.

Τὸ μὲν γὰρ πρῶτον ὀκτάεδρόν ἐστιν περιεχόμενον ὑπὸ τριγώνων δ καὶ ἑξαγώνων δ.

Τρία δὲ μετὰ τοῦτο τεσσαρεσκαιδεκάεδρα, ὧν τὸ μὲν πρῶτον περιέχεται τριγώνοις η̄ καὶ τετραγώνοις ε̄, τὸ δὲ δεύτερον τετραγώνοις ε̄ καὶ ἑξαγώνοις η̄, τὸ δὲ τρίτον τριγώνοις η̄ καὶ ὀκταγώνοις ε̄.

Μετὰ δὲ ταῦτα ἑκκαίδεκοσάεδρά ἐστιν δύο, ὧν τὸ μὲν πρῶτον περιέχεται τριγώνοις η̄ καὶ τετραγώνοις ιη̄, τὸ δὲ δεύτερον τετραγώνοις ιβ̄, ἑξαγώνοις η̄ καὶ ὀκταγώνοις ε̄.

Μετὰ δὲ ταῦτα δυοκαϊτριακοντάεδρά ἐστιν τρία, ὧν τὸ μὲν πρῶτον περιέχεται τριγώνοις κ̄ καὶ πενταγώνοις ιβ̄, τὸ δὲ δεύτερον πενταγώνοις ιβ̄ καὶ ἑξαγώνοις κ̄, τὸ δὲ τρίτον τριγώνοις κ̄ καὶ δεκαγώνοις ιβ̄.

Μετὰ δὲ ταῦτα ἓν ἐστιν ὀκτωκαϊτριακοντάεδρον περιεχόμενον ὑπὸ τριγώνων λβ̄ καὶ τετραγώνων ε̄.

Μετὰ δὲ τοῦτο δυοκαϊεξηκοντάεδρά ἐστι δύο, ὧν τὸ μὲν πρῶτον περιέχεται τριγώνοις κ̄ καὶ τετραγώνοις λ̄ καὶ πενταγώνοις ιβ̄, τὸ δὲ δεύτερον τετραγώνοις λ̄ καὶ ἑξαγώνοις κ̄ καὶ δεκαγώνοις ιβ̄.

Μετὰ δὲ ταῦτα τελευταῖόν ἐστιν δυοκαϊεπενήκοντάεδρον, ὃ περιέχεται τριγώνοις π̄ καὶ πενταγώνοις ιβ̄.

^a For the purposes of n. b, the thirteen polyhedra will be designated as P_1, P_2, \dots, P_{13} .

^b Kepler, in his *Harmonice mundi* (Opera, 1864, v. 123-126), appears to have been the first to examine these figures systematically, though a method of obtaining some is given in a scholium to the Vatican ms. of Pappus. If a solid angle of a regular solid be cut by a plane so that the same length is cut off from each of the edges meeting at the solid angle,

ARCHIMEDES

The first is a figure of eight bases, being contained by four triangles and four hexagons $[P_1]$.^a

After this come three figures of fourteen bases, the first contained by eight triangles and six squares $[P_2]$, the second by six squares and eight hexagons $[P_3]$, and the third by eight triangles and six octagons $[P_4]$.

After these come two figures of twenty-six bases, the first contained by eight triangles and eighteen squares $[P_5]$, the second by twelve squares, eight hexagons and six octagons $[P_6]$.

After these come three figures of thirty-two bases, the first contained by twenty triangles and twelve pentagons $[P_7]$, the second by twelve pentagons and twenty hexagons $[P_8]$, and the third by twenty triangles and twelve decagons $[P_9]$.

After these comes one figure of thirty-eight bases, being contained by thirty-two triangles and six squares $[P_{10}]$.

After this come two figures of sixty-two bases, the first contained by twenty triangles, thirty squares and twelve pentagons $[P_{11}]$, the second by thirty squares, twenty hexagons and twelve decagons $[P_{12}]$.

After these there comes lastly a figure of ninety-two bases, which is contained by eighty triangles and twelve pentagons $[P_{13}]$.^b

the section is a regular polygon which is a triangle, square or pentagon according as the solid angle is composed of three, four or five plane angles. If certain equal lengths be cut off in this way from all the solid angles, regular polygons will also be left in the faces of the solid. This happens (i) obviously when the cutting planes bisect the edges of the solid, and (ii) when the cutting planes cut off a smaller length from each edge in such a way that a regular polygon is left in each face with double the number of sides. This method gives (1) from the tetrahedron, P_1 ; (2) from the

cube, P_2 and P_4 ; (3) from the octahedron, P_2 and P_3 ; (4) from the icosahedron, P_7 and P_8 ; (5) from the dodecahedron, P_7 and P_9 . It was probably the method used by Plato.

Four more of the semi-regular solids are obtained by first cutting all the edges symmetrically and equally by planes parallel to the edges, and then cutting off angles. This

ARCHIMEDES

(g) SYSTEM OF EXPRESSING LARGE NUMBERS

Archimedes, *Sand-Reckoner* 3, Archim., ed.

Heiberg ii. 236. 17-240. 1

Such are then the assumptions I make; but I think it would be useful to explain the naming of the numbers, in order that, as in other matters, those who have not come across the book sent to Zeuxippus may not find themselves in difficulty through the fact that there had been no preliminary discussion of it in this book. Now we already have names for the numbers up to a myriad [10^4], and beyond a myriad we can count in myriads up to a myriad myriads [10^8]. Therefore, let the aforesaid numbers up to a myriad myriads be called *numbers of the first order* [numbers from 1 to 10^8], and let a myriad myriads of numbers of the first order be called a unit of *numbers of the second order* [numbers from 10^8 to 10^{16}], and let units of the numbers of the second order be enumerable, and out of the units let there be formed tens and hundreds and thousands and myriads up to a myriad myriads. Again, let a myriad myriads of numbers of the second order be called a unit of *numbers of the third order* [numbers from 10^{16} to 10^{24}], and let units of numbers of the third order be enumerable, and from the units let there be formed tens and hundreds and thousands and myriads up to a myriad myriads. In the same manner, let a myriad myriads of numbers of the third order be gives (1) from the cube, P_5 and P_6 ; (2) from the icosahedron, P_{11} ; (3) from the dodecahedron, P_{12} .

The two remaining solids are more difficult to obtain; P_{10} is the *snub cube* in which each solid angle is formed by the angles of four equilateral triangles and one square; P_{13} is the *snub dodecahedron* in which each solid angle is formed by the angles of four equilateral triangles and one regular pentagon.

* Expressed in full, the last number would be 1 followed by 80,000 million millions of ciphers. Archimedes uses this system to show that it is more than sufficient to express the number of grains of sand which it would take to fill the universe, basing his argument on estimates by astronomers of the sizes and distances of the sun and moon and their relation to the size of the universe and allowing a wide margin for safety. Assuming that a poppy-head (for so *μήκων* is here to be understood, not "poppy-seed," v. 1) Arey W. Thompson, *The Classical Review*, lvi. (1912), p. 75) would contain not more than 10,000 grains of sand, and that its diameter is not less than a finger's breadth, and having proved that the

ARCHIMEDES

called a unit of *numbers of the fourth order* [numbers from 10^{24} to 10^{32}], and let a myriad myriads of numbers of the fourth order be called a unit of *numbers of the fifth order* [numbers from 10^{32} to 10^{40}], and let the process continue in this way until the designations reach a myriad myriads taken a myriad myriad times [$10^8 \cdot 10^8$].

It is sufficient to know the numbers up to this point, but we may go beyond it. For let the numbers now mentioned be called *numbers of the first period* [1 to $10^8 \cdot 10^8$], and let the last number of the first period be called a unit of *numbers of the first order of the second period* [$10^8 \cdot 10^8$ to $10^8 \cdot 10^8 \cdot 10^8$]. And again, let a myriad myriads of numbers of the first order of the second period be called a unit of *numbers of the second order of the second period* [$10^8 \cdot 10^8 \cdot 10^8$ to $10^8 \cdot 10^8 \cdot 10^{16}$]. Similarly let the last of these numbers be called a unit of *numbers of the third order of the second period* [$10^8 \cdot 10^8 \cdot 10^{16}$ to $10^8 \cdot 10^8 \cdot 10^{24}$], and let the process continue in this way until the designations of numbers in the second period reach a myriad myriads taken a myriad myriad times [$10^8 \cdot 10^8 \cdot 10^8 \cdot 10^8$, or $(10^8 \cdot 10^8)^2$].

Again, let the last number of the second period be called a unit of *numbers of the first order of the third period* [$(10^8 \cdot 10^8)^2$ to $(10^8 \cdot 10^8)^2 \cdot 10^8$], and let the process continue in this way up to a myriad myriad units of *numbers of the myriad myriadth order of the myriad myriadth period* [$(10^8 \cdot 10^8)^{10^8}$ or $10^8 \cdot 10^{16}$].^a

sphere of the fixed stars is less than 10^7 times the sphere in which the sun's orbit is a great circle, Archimedes shows that the number of grains of sand which would fill the universe is less than "10,000,000 units of the eighth order of numbers," or 10^{63} . The work contains several references important for the history of astronomy.

ARCHIMEDES

(h) INDETERMINATE ANALYSIS : THE CATTLE PROBLEM

Archimedes (?), *Cattle Problem*,^a Archim. ed. Heiberg
ii. 528. 1-532. 9

A PROBLEM

which Archimedes solved in epigrams, and which he communicated to students of such matters at Alexandria in a letter to Eratosthenes of Cyrene.

If thou art diligent and wise, O stranger, compute the number of cattle of the Sun, who once upon a time grazed on the fields of the Thrinacian isle of Sicily, divided into four herds of different colours, one milk white, another a glossy black, the third yellow and the last dappled. In each herd were bulls, mighty in number according to these proportions: Understand, stranger, that the white bulls were equal to a half and a third of the black together with the whole of the yellow, while the black were equal to the fourth part of the dappled and a fifth, together with, once more, the whole of the yellow. Observe further that the remaining bulls, the dappled, were equal to a sixth part of the white and a seventh, together with all the yellow. These were the proportions of the cows: The white were precisely equal to the third part and a fourth of the whole herd of the black; while the black were equal to the fourth part once more of the dappled and with it a fifth part, when all, including the bulls, went to pasture together. Now

^a It is unlikely that the epigram itself, first edited by G. E. Lessing in 1773, is the work of Archimedes, but there is ample evidence from antiquity that he studied the actual problem. The most important papers bearing on the subject have already been mentioned (vol. i. p. 16 n. c), and further references to the literature are given by Heiberg *ad loc.*

¹ πλήθους Krumbiegel, πλήθου cod.

^a i.e. a fifth and a sixth both of the males and of the females.

^b At a first glance this would appear to mean that the sum of the number of white and black bulls is a square, but this makes the solution of the problem intolerably difficult. There is, however, an easier interpretation. If the bulls are packed together so as to form a square figure, their number need not be a square, since each bull is longer than it is broad. The simplified condition is that the sum of the number of white and black bulls shall be a rectangle.

ARCHIMEDES

the dappled in four parts^a were equal in number to a fifth part and a sixth of the yellow herd. Finally the yellow were in number equal to a sixth part and a seventh of the white herd. If thou canst accurately tell, O stranger, the number of cattle of the Sun, giving separately the number of well-fed bulls and again the number of females according to each colour, thou wouldst not be called unskilled or ignorant of numbers, but not yet shalt thou be numbered among the wise. But come, understand also all these conditions regarding the cows of the Sun. When the white bulls mingled their number with the black, they stood firm, equal in depth and breadth,^b and the plains of Thrinacia, stretching far in all ways, were filled with their multitude. Again, when the yellow and the dappled bulls were gathered into one herd they stood in such a manner that their number, beginning from one, grew slowly greater till it completed a triangular figure, there being no bulls of other colours in their midst nor none of them lacking. If thou art able, O stranger, to find out all these things and gather them together in your mind, giving all the relations, thou shalt depart crowned with glory and knowing that thou hast been adjudged perfect in this species of wisdom.^c

^a If

X, x are the numbers of white bulls and cows respectively,

Y, y " " " black " " "

Z, z " " " yellow " " "

W, w " " " dappled " " "

the first part of the epigram states that

$$(a) \quad X = \left(\frac{1}{5} + \frac{1}{6}\right) Y + Z \quad . \quad . \quad . \quad . \quad (1)$$

$$Y = \left(\frac{1}{6} + \frac{1}{7}\right) W + Z \quad . \quad . \quad . \quad . \quad (2)$$

$$W = \left(\frac{1}{8} + \frac{1}{9}\right) X + Z \quad . \quad . \quad . \quad . \quad (3)$$

Heiberg ii. 124. 3-126. 3

α'. Αἰτούμεθα τὰ ἴσα βάρεια ἀπὸ ἴσων μακέων
ισορροπεῖν, τὰ δὲ ἴσα βύρεια ἀπὸ τῶν ἀνίσων
μακέων μὴ ἰσορροπεῖν, ἀλλὰ ῥέπειν ἐπὶ τὸ βίρος
τὸ ἀπὸ τοῦ μείζονος μάκεος.

(b)	$x = (\frac{1}{3} + \frac{1}{4})(Y + y)$ (1)
	$y = (\frac{1}{4} + \frac{1}{5})(W + w)$ (5)
	$w = (\frac{1}{5} + \frac{1}{6})(Z + z)$ (6)
	$z = (\frac{1}{6} + \frac{1}{7})(X + x)$ (7)

The second part of the epigram states that

$$X + Y = \text{a rectangular number} \quad . \quad . \quad (8)$$

$$Z + W = \text{a triangular number} \quad . \quad . \quad (9)$$

This was solved by J. F. Wurm, and the solution is given by A. Amthor, *Zeitschrift für Math. u. Physik. (Hist.-litt. Abtheilung)*, xxv. (1880), pp. 153-171, and by Heath, *The Works of Archimedes*, pp. 319-326. For reasons of space, only the results can be noted here.

Equations (1) to (7) give the following as the values of the unknowns in terms of an unknown integer n :

$X = 10366482n$	$x = 7206360n$
$Y = 7460514n$	$y = 4893246n$
$Z = 4149387n$	$z = 5439213n$
$W = 7358060n$	$w = 3515820n$

We have now to find a value of n such that equation (9) is also satisfied—equation (8) will then be simultaneously satisfied. Equation (9) means that

$$Z + W = \frac{p(p+1)}{2},$$

where p is some positive integer, or

$$(4149387 + 7358060)n = \frac{p(p+1)}{2},$$

ARCHIMEDES

(i) MECHANICS: CENTRES OF GRAVITY

(i.) *Postulates*

Archimedes, *On Plane Equilibriums*,^a Definitions,
Archim. cd. Heiberg ii. 124. 3-126. 3

1. I postulate that equal weights at equal distances balance, and equal weights at unequal distances do not balance, but incline towards the weight which is at the greater distance.

i.e. $2471 \cdot 4657n = \frac{p(p+1)}{2}.$

This is found to be satisfied^a by

$$n = 3^3 \cdot 4349,$$

and the final solution is

$X = 1217263415886$	$w = 846192410280$
$Y = 876035935422$	$y = 574579625058$
$Z = 487233469701$	$z = 638688708099$
$W = 864005479380$	$w = 412838131860$

and the total is 5916837175686.

If equation (8) is taken to be that $X + Y =$ a square number, the solution is much more arduous; Amthor found that in this case,

$$W = 1598 \langle 206541 \rangle,$$

where $\langle 206541 \rangle$ means that there are 206541 more digits to follow, and the whole number of cattle = 7766 $\langle 206541 \rangle$. Merely to write out the eight numbers, Amthor calculates, would require a volume of 660 pages, so we may reasonably doubt whether the problem was really framed in this more difficult form, or, if it were, whether Archimedes solved it.

^a This is the earliest surviving treatise on mechanics; it presumably had predecessors, but we may doubt whether mechanics had previously been developed by rigorous geometrical principles from a small number of assumptions. References to the principle of the lever and the parallelogram of velocities in the Aristotelian *Mechanics* have already been given (vol. i. pp. 430-433).

ARCHIMEDES

2. If weights at certain distances balance, and something is added to one of the weights, they will not remain in equilibrium, but will incline towards that weight to which the addition was made.

3. Similarly, if anything be taken away from one of the weights, they will not remain in equilibrium, but will incline towards the weight from which nothing was subtracted.

4. When equal and similar plane figures are applied one to the other, their centres of gravity also coincide.

5. In unequal but similar figures, the centres of gravity will be similarly situated. By points similarly situated in relation to similar figures, I mean points such that, if straight lines be drawn from them to the equal angles, they make equal angles with the corresponding sides.

6. If magnitudes at certain distances balance, magnitudes equal to them will also balance at the same distances.

7. In any figure whose perimeter is concave in the same direction, the centre of gravity must be within the figure.

(ii.) *Principle of the Lever*

Ibid., Props. 6 and 7, Archim. ed. Heiberg
ii. 132. 13-138. 8

Prop. 6

Commensurable magnitudes balance at distances reciprocally proportional to their weights.

Let A, B be commensurable magnitudes with centres [of gravity] A, B, and let EΔ be any distance, and let

$$A : B = \Delta \Gamma : \Gamma E ;$$

μᾶκος· δεικτέον, ὅτι τοῦ ἐξ ἀμφοτέρων τῶν Α, Β συγκειμένου μεγέθεος κέντρον ἐστὶ τοῦ βάρους τὸ Γ.

Ἐπεὶ γάρ ἐστιν, ὡς τὸ Α ποτὶ τὸ Β, οὕτως τὸ ΔΓ ποτὶ τὸ ΓΕ, τὸ δὲ Α τῷ Β σύμμετρον, καὶ τὸ ΓΔ ἄρα τῷ ΓΕ σύμμετρον, τουτέστιν εὐθεία τῇ εὐθείᾳ· ὥστε τῶν ΕΓ, ΓΔ ἐστὶ κοινὸν μέτρον. ἔστω δὴ τὸ Ν, καὶ κείσθω τῇ μὲν ΕΓ ἴσα ἑκάτερα τῶν ΔΗ, ΔΚ, τῇ δὲ ΔΓ ἴσα ἡ ΕΛ. καὶ ἐπεὶ ἴσα

ἡ ΔΗ τῇ ΓΕ, ἴσα καὶ ἡ ΔΓ τῇ ΕΗ· ὥστε καὶ ἡ ΛΕ ἴσα τῇ ΕΗ. διπλασία ἄρα ἡ μὲν ΛΗ τῆς ΔΓ, ἡ δὲ ΗΚ τῆς ΓΕ· ὥστε τὸ Ν καὶ ἑκατέραν τῶν ΛΗ, ΗΚ μετρεῖ, ἐπειδήπερ καὶ τὰ ἡμίσεα αὐτῶν. καὶ ἐπεὶ ἐστὶν, ὡς τὸ Α ποτὶ τὸ Β, οὕτως ἡ ΔΓ ποτὶ ΓΕ, ὡς δὲ ἡ ΔΓ ποτὶ ΓΕ, οὕτως ἡ ΛΗ ποτὶ ΗΚ—διπλασία γὰρ ἑκάτερα ἑκατέρας—καὶ ὡς ἄρα τὸ Α ποτὶ τὸ Β, οὕτως ἡ ΛΗ ποτὶ ΗΚ. ὅσαπλασίων δὲ ἐστὶν ἡ ΛΗ τῆς Ν, τουσιν-

ARCHIMEDES

it is required to prove that the centre of gravity of the magnitude composed of both A, B is Γ .

Since $A : B = \Delta\Gamma : \Gamma E$,

and A is commensurate with B, therefore $\Gamma\Delta$ is commensurate with ΓE , that is, a straight line with a straight line [Eucl. x. 11]; so that $E\Gamma$, $\Gamma\Delta$ have a common measure. Let it be N, and let ΔH , ΔK be each equal to $E\Gamma$, and let $E\Lambda$ be equal to $\Delta\Gamma$. Then since $\Delta H = \Gamma E$, it follows that $\Delta\Gamma = EH$; so that $\Lambda EE = H$. Therefore $\Lambda H = 2\Delta\Gamma$ and $HK = 2\Gamma E$; so that N measures both ΛH and HK , since it measures their halves [Eucl. x. 12]. And since

$$A : B = \Delta\Gamma : \Gamma E,$$

while $\Delta\Gamma : \Gamma E = \Lambda H : HK$ —

for each is double of the other—

therefore $A : B = \Lambda H : HK$.

Now let Z be the same part of A as N is of ΛH ;

ταπλασίων ἔστω καὶ τὸ A τοῦ Z . ἔστιν ἄρα, ὡς ἂν ΛH ποτὶ N , οὕτως τὸ A ποτὶ Z . ἔστι δὲ καί, ὡς ἂν KH ποτὶ ΛH , οὕτως τὸ B ποτὶ A . δι' ἴσου ἄρα ἐστίν, ὡς ἂν KH ποτὶ N , οὕτως τὸ B ποτὶ Z . ἰσάκεις ἄρα πολλαπλασίων ἐστὶν ἂν KH τῆς N καὶ τὸ B τοῦ Z . ἐδείχθη δὲ τοῦ Z καὶ τὸ A πολλαπλάσιον ἑόν· ὥστε τὸ Z τῶν Λ, B κοινόν ἐστι μέτρον.· διαιρεθείσας οὖν τῆς μὲν ΛH εἰς τὰς τῆς N ἴσας, τοῦ δὲ A εἰς τὰ τῶν Z ἴσα, τὰ ἐν τῇ ΛH τμήματα ἰσομεγέθεα τῇ N ἴσα ἐσσεύεται τῷ πλήθει τοῖς ἐν τῇ A τμαμάτεσσιν ἴσοις ἐοῦσιν τῷ Z . ὥστε, ἂν ἐφ' ἕκαστον τῶν τμαμάτων τῶν ἐν τῇ ΛH ἐπιτεθῇ μέγεθος ἴσον τῷ Z τὸ κέντρον τοῦ βάρους ἔχον ἐπὶ μέσου τοῦ τμήματος, τὰ τε πάντα μεγέθεα ἴσα ἐντὶ τῷ A , καὶ τοῦ ἐκ πάντων συγκειμένου κέντρον ἐσσεύεται τοῦ βάρους τὸ E . ἄρτιά τε γάρ ἐστι τὰ πάντα τῷ πλήθει, καὶ τὰ ἐφ' ἑκάτερα τοῦ E ἴσα τῷ πλήθει διὰ τὸ ἴσαν εἶμεν τὰν ΛE τῇ HE .

Ὅμοιως δὲ δειχθήσεται, ὅτι καὶ, εἴ κα ἐφ' ἕκαστον τῶν ἐν τῇ KH τμαμάτων ἐπιτεθῇ μέγεθος ἴσον τῷ Z κέντρον τοῦ βάρους ἔχον ἐπὶ τοῦ μέσου τοῦ τμήματος, τὰ τε πάντα μεγέθεα ἴσα ἐσσεύεται τῷ B , καὶ τοῦ ἐκ πάντων συγκειμένου κέντρον τοῦ βάρους ἐσσεύεται τὸ Δ . ἐσσεύεται οὖν τὸ μὲν A ἐπικείμενον κατὰ τὸ E , τὸ δὲ B κατὰ τὸ Δ . ἐσσεύεται δὴ μεγέθεα ἴσα ἀλλάλοις ἐπ' εὐθείας κείμενα, ὧν τὰ κέντρα τοῦ βάρους ἴσα ἀπ' ἀλλήλων διέστακεν, [συγκείμενα]¹ ἄρτια τῷ πλήθει· δηλον οὖν, ὅτι τοῦ ἐκ πάντων συγκειμένου μεγέθεος κέντρον ἐστὶ τοῦ βάρους ἡ διχοτομία τῆς εὐθείας τῆς ἐχούσας τὰ κέντρα τῶν μέσων μεγεθέων. ἐπεὶ δ' ἴσαι ἐντὶ

ARCHIMEDES

then $\Delta H : N = A : Z$. [Eucl. v., Def. 5]

And $KH : \Delta H = B : A$; [Eucl. v. 7, coroll.]

therefore, *ex aequo*,

$KH : N = B : Z$; [Eucl. v. 22]

therefore Z is the same part of B as N is of KH . Now A was proved to be a multiple of Z ; therefore Z is a common measure of A , B . Therefore, if ΔH is divided into segments equal to N and A into segments equal to Z , the segments in ΔH equal in magnitude to N will be equal in number to the segments of A equal to Z . It follows that, if there be placed on each of the segments in ΔH a magnitude equal to Z , having its centre of gravity at the middle of the segment, the sum of the magnitudes will be equal to A , and the centre of gravity of the figure compounded of them all will be E ; for they are even in number, and the numbers on either side of E will be equal because $\Delta E = HE$. [Prop. 5, coroll. 2.]

Similarly it may be proved that, if a magnitude equal to Z be placed on each of the segments [equal to N] in KH , having its centre of gravity at the middle of the segment, the sum of the magnitudes will be equal to B , and the centre of gravity of the figure compounded of them all will be Δ [Prop. 5, coroll. 2]. Therefore A may be regarded as placed at E , and B at Δ . But they will be a set of magnitudes lying on a straight line, equal one to another, with their centres of gravity at equal intervals, and even in number; it is therefore clear that the centre of gravity of the magnitude compounded of them all is the point of bisection of the line containing the centres [of gravity] of the middle magnitudes [from Prop. 5, coroll. 2].

ARCHIMEDES

And since $\Lambda E = \Gamma \Delta$ and $E\Gamma = \Delta K$, therefore $\Lambda\Gamma = \Gamma K$; so that the centre of gravity of the magnitude compounded of them all is the point Γ . Therefore if A is placed at E and B at Δ , they will balance about Γ .

Prop. 7

And now, if the magnitudes be incommensurable, they will likewise balance at distances reciprocally proportional to the magnitudes.

Let $(A + B)$, Γ be incommensurable magnitudes,^a and let ΔE , EZ be distances, and let

$$(A + B) : \Gamma = E\Delta : EZ ;$$

I say that the centre of gravity of the magnitude composed of both $(A + B)$, Γ is E .

For if $(A + B)$ placed at Z do not balance Γ placed at Δ , either $(A + B)$ is too much greater than Γ to balance or less. Let it [first] be too much greater, and let there be subtracted from $(A + B)$ a magnitude less than the excess by which $(A + B)$ is too much greater than Γ to balance, so that the remainder A is

^a As becomes clear later in the proof, the first magnitude is regarded as made up of two parts— A , which is commensurate with Γ and B , which is not commensurate; if $(A + B)$ is too big for equilibrium with Γ , then B is so chosen that, when it is taken away, the remainder A is still too big for equilibrium with Γ . Similarly if $(A + B)$ is too small for equilibrium.

¹ δὲ om. Heiberg.

^a The proof is incomplete and obscure; it may be thus completed.

Since

$A : \Gamma < \Delta E : EZ,$

Δ will be depressed, which is impossible, since there has been taken away from $(A + B)$ a magnitude less than the deduc-

ARCHIMEDES

commensurate with Γ . Then, since A, Γ are commensurable magnitudes, and

$$A : \Gamma < \Delta E : EZ,$$

A, Γ will not balance at the distances $\Delta E, EZ$, A being placed at Z and Γ at Δ . By the same reasoning, they will not do so if Γ is greater than the magnitude necessary to balance $(A + B)$.^a

(iii.) *Centre of Gravity of a Parallelogram*^b

Ibid., Props. 9 and 10, Archim. ed. Heiberg
ii. 140⁷ 16-144. 4

Prop. 9

The centre of gravity of any parallelogram is on the straight line joining the points of bisection of opposite sides of the parallelogram.

Let $AB\Gamma\Delta$ be a parallelogram, and let EZ be the straight line joining the mid-points of $AB, \Gamma\Delta$; then I say that the centre of gravity of the parallelogram $AB\Gamma\Delta$ will be on EZ .

For if it be not, let it, if possible, be Θ , and let ΘI be drawn parallel to AB . Now if EB be bisected, and the half be bisected, and so on continually, there will be left some line less than $I\Theta$; [let EK be less than

tion necessary to produce equilibrium, so that Z remains depressed. Therefore $(A + B)$ is not greater than the magnitude necessary to produce equilibrium; in the same way it can be proved not to be less; therefore it is equal.

^b The centres of gravity of a triangle and a trapezium are also found by Archimedes in the first book; the second book is wholly devoted to finding the centres of gravity of a parabolic segment and of a portion of it cut off by a parallel to the base.

ARCHIMEDES

$I\Theta$,] and let each of AE , EB be divided into parts equal to EK , and from the points of division let straight lines be drawn parallel to EZ ; then the whole parallelogram will be divided into parallelograms equal and similar to KZ . Therefore, if these parallelograms equal and similar to KZ be applied to each other, their centres of gravity will also coincide [Post. 4]. Thus there will be a set of magnitudes, being parallelograms equal to KZ , which are even in number and whose centres of gravity lie on a straight line, and the middle magnitudes will be equal, and the magnitudes on either side of the middle magnitudes will also be equal, and the straight lines between their centres [of gravity] will be equal; therefore the centre of gravity of the magnitude compounded of them all will be on the straight line joining the centres of gravity of the middle areas [Prop. 5, coroll. 2]. But it is not; for Θ lies without the middle parallelograms. It is therefore manifest that the centre of gravity of the parallelogram $AB\Gamma\Delta$ will be on the straight line EZ .

Prop. 10

The centre of gravity of any parallelogram is the point in which the diagonals meet.

ii. 426. 3-430. 22

Ἀρχιμήδης Ἐρατοσθένει εὖ πράττειν . . .
Ὅρῶν δέ σε, καθάπερ λέγω, σπουδαῖον καὶ φιλοσοφίας προεστώτα ἀξιολόγως καὶ τὴν ἐν τοῖς

* According to Heath (*H.G.M.* ii. 21), Wallis has observed that Archimedes might seem, "as it were of set purpose to have covered up the traces of his investigation, as if he had grudged posterity the secret of his method of inquiry, while he wished to extort from them assent to his results." A comparison of the *Method* with other treatises now reveals to us how Archimedes found the areas and volumes of certain figures. His method was to balance elements of the figure against elements of another figure whose mensuration was

ARCHIMEDES

For let $AB\Gamma\Delta$ be a parallelogram, and in it let EZ bisect AB , $\Gamma\Delta$ and let KA bisect $A\Gamma$, $B\Delta$; now the centre of gravity of the parallelogram $AB\Gamma\Delta$ is on EZ —for this has been proved. By the same reasoning it lies on KA ; therefore the point Θ is the centre of gravity. And the diagonals of the parallelogram meet at Θ ; so that the proposition has been proved.

(j) MECHANICAL METHOD IN GEOMETRY^a

Archimedes, *The Method*,^b Preface, Archim. ed. Heiberg
ii. 426. 3–430. 22

Archimedes to Eratosthenes^c greeting . . .

Moreover, seeing in you, as I say, a zealous student and a man of considerable eminence in philosophy, known. This gave him the result, and then he proved it by rigorous geometrical methods based on the principle of *reductio ad absurdum*.

The case of the parabola is particularly instructive. In the *Method*, Prop. 1, Archimedes conceives a segment of a parabola as made up of straight lines, and by his mechanical method he proves that the segment is four-thirds of the triangle having the same base and equal height. In the *Measurement of a Parabola*, Prop. 14, he conceives the parabola as made up of a large number of trapezia, and by mechanical methods again reaches the same result. This is more satisfactory, but still not completely rigorous, so in Prop. 24 he proves the theorem without any help from mechanics by *reductio ad absurdum*.

^b The *Method* had to be classed among the lost works of Archimedes until 1906, when it was discovered at Constantinople by Heiberg in the ms. which he has termed C. Unfortunately the ms. is often difficult to decipher, and students of the text should consult Heiberg's edition. Moreover, the diagrams have to be supplied as they are undecipherable in the ms.

ARCHIMEDES

who gives due honour to mathematical inquiries when they arise, I have thought fit to write out for you and explain in detail in the same book the peculiarity of a certain method, with which furnished you will be able to make a beginning in the investigation by mechanics of some of the problems in mathematics. I am persuaded that this method is no less useful even for the proof of the theorems themselves. For some things first became clear to me by mechanics, though they had later to be proved geometrically owing to the fact that investigation by this method does not amount to actual proof; but it is, of course, easier to provide the proof when some knowledge of the things sought has been acquired by this method rather than to seek it with no prior knowledge. . . . At the outset therefore I will write out the very first theorem that became clear to me through mechanics, that *any segment of a section of a right-angled cone is four-thirds of the triangle having the same base and equal height.*

Ibid., Prop. 1, Archim. ed. Heiberg ii. 434. 14-438. 21

Let $AB\Gamma$ be a segment bounded by the straight line $A\Gamma$ and the section $AB\Gamma$ of a right-angled cone, and let $A\Gamma$ be bisected at Δ , and let ΔBE be drawn parallel to the axis, and let AB , $B\Gamma$ be joined.

I say that the segment $AB\Gamma$ is four-thirds of the triangle $AB\Gamma$.

From the points A , Γ let AZ be drawn parallel to ΔBE , and let ΓZ be drawn to touch the section, and let ΓB be produced to K , and let $K\Theta$ be placed equal to ΓK . Let $\Gamma\Theta$ be imagined to be a balance

with mid-point K, and let $MΞ$ be drawn parallel to $EΔ$.

Then since $ΓΒΑ$ is a parabola,^a and $ΓΖ$ touches it, and $ΓΔ$ is a semi-ordinate, $EB = BΔ$ —for this is proved in the elements^b; for this reason, and because $ΖΑ$, $MΞ$ are parallel to $EΔ$, $MN = NΞ$ and $ZK = KA$ [Eucl. vi. 4, v. 9]. And since

$$ΓΑ : AΞ = MΞ : ΞΟ, \quad [\text{Quad. parab. 5,}$$

Eucl. v. 18

and $ΓΑ : AΞ = ΓΚ : ΚΝ$, [Eucl. vi. 2, v. 18

while $ΓΚ = ΚΘ$,

therefore $ΘΚ : ΚΝ = MΞ : ΞΟ$.

And since the point N is the centre of gravity of the straight line $MΞ$, inasmuch as $MN = NΞ$ [Lemma 4], if we place $TH = ΞΟ$, with $Θ$ for its centre of gravity, so that $TΘ = ΘH$ [Lemma 4], then $TΘH$ will balance $MΞ$ in its present position, because $ΘN$ is cut

^a Archimedes would have said "section of a right-angled cone"—*ὀρθογωνίου κώνου τομή*.

^b The reference will be to the *Elements of Conics* by Euclid and Aristaeus for which v. vol. i. pp. 186-191 and *infra*, p. 280 n. a; cf. similar expressions in *On Conoids and Spheroids*, Prop. 3 and *Quadrature of a Parabola*, Prop. 3; the theorem is *Quadrature of a Parabola*, Prop. 2.

¹ τοῦτο . . . δέκνεται om. Heiberg. It is probably an interpolator's reference to a marginal lemma.

τὴν ΘΝ τοῖς ΤΗ, ΜΕ βάρεσιν, καὶ ὡς τὴν ΘΚ πρὸς ΚΝ, οὕτως τὴν ΜΕ πρὸς τὴν ΗΤ· ὥστε τοῦ ἐξ ἀμφοτέρων βάρους κέντρον ἐστὶν τοῦ βάρους τὸ Κ. ὁμοίως δὲ καί, ὅσαι ἂν ἀχθῶσιν ἐν τῷ ΖΑΓ τριγώνῳ παράλληλοι τῇ ΕΔ, ἰσορροπήσουσιν αὐτοῦ μένουσαι ταῖς ἀπολαμβανομέναις ἀπ' αὐτῶν ὑπὸ τῆς τομῆς μετενεχθείσαις ἐπὶ τὸ Θ, ὥστε εἶναι τοῦ ἐξ ἀμφοτέρων κέντρον τοῦ βάρους τὸ Κ. καὶ ἐπεὶ ἐκ μὲν τῶν ἐν τῷ ΓΖΑ τριγώνῳ τὸ ΓΖΑ τρίγωνον συνέστηκεν, ἐκ δὲ τῶν ἐν τῇ τομῇ ὁμοίως τῇ ΕΟ λαμβανομένων συνέστηκε τὸ ΑΒΓ τμήμα, ἰσορροπήσει ἄρα τὸ ΖΑΓ τρίγωνον αὐτοῦ μένον τῷ τμήματι τῆς τομῆς τεθέντι περὶ κέντρον τοῦ βάρους τὸ Θ κατὰ τὸ Κ σημεῖον, ὥστε τοῦ ἐξ ἀμφοτέρων κέντρον εἶναι τοῦ βάρους τὸ Κ. τετμήσθω δὴ ἡ ΓΚ τῷ Χ, ὥστε τριπλασίαν εἶναι τὴν ΓΚ τῆς ΚΧ· ἔσται ἄρα τὸ Χ σημεῖον κέντρον βάρους τοῦ ΑΖΓ τριγώνου· δέδεικται γὰρ ἐν τοῖς Ἰσορροπικοῖς. ἐπεὶ οὖν ἰσόρροπον τὸ ΖΑΓ τρίγωνον αὐτοῦ μένον τῷ ΒΑΓ τμήματι κατὰ τὸ Κ τεθέντι περὶ τὸ Θ κέντρον τοῦ βάρους, καὶ ἐστὶν τοῦ ΖΑΓ τριγώνου κέντρον βάρους τὸ Χ, ἔστιν ἄρα, ὡς τὸ ΑΖΓ τρίγωνον πρὸς τὸ ΑΒΓ τμήμα κείμενον περὶ τὸ Θ κέντρον, οὕτως ἡ ΘΚ πρὸς ΧΚ. τριπλασία δὲ ἐστὶν ἡ ΘΚ τῆς ΚΧ· τριπλασίον ἄρα καὶ τὸ ΑΖΓ τρίγωνον τοῦ ΑΒΓ τμήματος. ἔστι δὲ καὶ τὸ ΖΑΓ τρίγωνον τετραπλάσιον τοῦ ΑΒΓ τριγώνου διὰ τὸ ἴσην εἶναι τὴν μὲν ΖΚ τῇ ΚΑ, τὴν δὲ ΑΔ τῇ ΔΓ· ἐπίτριτοι ἄρα ἐστὶν τὸ ΑΒΓ τμήμα τοῦ ΑΒΓ τριγώνου. [τοῦτο οὖν φανερόν ἐστιν].¹

¹ τοῦτο . . . ἐστὶν om. Heiberg.

ARCHIMEDES

in the inverse proportion of the weights TH , $MΞ$,
and $ΘK : KN = MΞ : HT$;

therefore the centre of gravity of both $[TH, MΞ]$ taken together is K . In the same way, as often as parallels to $EΔ$ are drawn in the triangle $ZΑΓ$, these parallels, remaining in the same position, will balance the parts cut off from them by the section and transferred to $Θ$, so that the centre of gravity of both together is K . And since the triangle $ΓZA$ is composed of the [straight lines drawn] in $ΓZA$, and the segment $ABΓ$ is composed of the lines in the section formed in the same way as $ΞO$, therefore the triangle $ZΑΓ$ in its present position will be balanced about K by the segment of the section placed with $Θ$ for its centre of gravity, so that the centre of gravity of both combined is K . Now let $ΓK$ be cut at X so that $ΓK = 3KX$; then the point X will be the centre of gravity of the triangle $AZIΓ$; for this has been proved in the books *On Equilibriums*.^a Then since the triangle $ZΑΓ$ in its present position is balanced about K by the segment $BAΓ$ placed so as to have $Θ$ for its centre of gravity, and since the centre of gravity of the triangle $ZΑΓ$ is X , therefore the ratio of the triangle $AZIΓ$ to the segment $ABΓ$ placed about $Θ$ as its centre [of gravity] is equal to $ΘK : XK$. But $ΘK = 3KX$; therefore

triangle $AZIΓ = 3 \cdot$ segment $ABΓ$.

And triangle $ZΑΓ = 4 \cdot$ triangle $ABΓ$,

because $ZK = KA$ and $ΑΔ = ΔΓ$;

therefore segment $ABΓ = \frac{4}{3}$ triangle $ABΓ$.

This, indeed, has not been actually demonstrated by the arguments now used, but they have given some indication that the conclusion is true ; seeing, therefore, that the theorem is not demonstrated, but suspecting that the conclusion is true, we shall have recourse ^a to the geometrical proof which I myself discovered and have already published.^b

Archimedes, *Quadrature of a Parabola*, Preface, Archim.
ed. Heiberg ii. 262. 2-266. 4

Archimedes to Dositheus greeting.

On hearing that Conon, who fulfilled in the highest degree the obligations of friendship, was dead, but that you were an acquaintance of Conon and also versed in geometry, while I grieved for the death of a friend and an excellent mathematician, I set myself the task of communicating to you, as I had determined to communicate to Conon, a certain geometrical theorem, which had not been investigated before, but has now been investigated by me, and which I first discovered by means of mechanics and later proved by means of geometry. Now some of those who in former times engaged in mathematics tried to find a rectilineal area equal to a given circle ^c and to a given segment of a circle, and afterwards they tried to square the area bounded by the section

^a I have followed Heath's rendering of *τάξομεν*, which seems more probable than Heiberg's "suo loco proponemus," though it is a different meaning to extract from *τάξομεν*.

^b Presumably *Quadr. Parab.* 24, the second of the proofs now to be given. The theorem has not been demonstrated, of course, because the triangle and the segment may not be supposed to be composed of straight lines.

^c This seems to indicate that Archimedes had not at this time written his own book *On the Measurement of a Circle*. For attempts to square the circle, c. vol. i. pp. 308-347.

of the whole cone and a straight line,^a assuming lemmas far from obvious, so that it was recognized by most people that the problem had not been solved. But I do not know that any of my predecessors has attempted to square the area bounded by a straight line and a section of a right-angled cone, the solution of which problem I have now discovered ; for it is shown that *any segment bounded by a straight line and a section of a right-angled cone is four-thirds of the triangle which has the same base and height equal to the segment*, and for the proof this lemma is assumed : *given [two] unequal areas, the excess by which the greater exceeds the less can, by being added to itself, be made to exceed any given finite area*. Earlier geometers have also used this lemma : for, by using this same lemma, they proved that circles are to one another in the duplicate ratio of their diameters, and that spheres are to one another in the triplicate ratio of their diameters, and also that any pyramid is a third part of the prism having the same base as the pyramid and equal height ; and, further, by assuming a lemma similar to that aforesaid, they proved that any cone is a third part of the cylinder having the same base as the cone and equal height.^b In the event, each of the aforesaid theorems has been accepted, no less than those proved without this lemma ; and it will satisfy me if the theorems now published by me obtain the same degree of acceptance. I have therefore written out the proofs, and now send them, first

^a A "section of the whole cone" is probably a section cutting right through it, *i.e.*, an ellipse, but the expression is odd.

^b For this lemma, *v. supra*, p. 46 n. a.

ARCHIMEDES

section of the cone let straight lines be drawn to Γ and produced. Then I say that the triangle $B\Delta\Gamma$ is less than three times the trapezia KE , ΛZ , MH , NI and the triangle $\Xi I\Gamma$, but greater than three times the trapezia $Z\Phi$, $H\Theta$, III and the triangle $IO\Gamma$.

For let the straight line $AB\Gamma$ be drawn, and let AB be cut off equal to $B\Gamma$, and let $A\Gamma$ be imagined to be a balance; its middle point will be B ; let it be suspended from B , and let the triangle $B\Delta\Gamma$ be suspended from the balance at B , Γ , and from the other part of the balance let the areas P , X , Ψ , Ω , Δ be suspended at A , and let the area P balance the trapezium ΔE in this position, let X balance the trapezium $Z\Sigma$, let Ψ balance TH , let Ω balance YI , and let Δ balance the triangle $\Xi I\Gamma$; then the whole will balance the whole; so that the triangle $B\Delta\Gamma$ will be three times the area $P + X + \Psi + \Omega + \Delta$ [Prop. 6]. And since $B\Gamma\Theta$ is a segment bounded by a straight line and a section of a right-angled cone, and $B\Delta$ has been drawn from B parallel to the axis, and $\Gamma\Delta$ has been drawn from Γ touching the section of a cone at Γ , and another straight line ΣE has been drawn parallel to the axis,

$$B\Gamma : BE = \Sigma E : E\Phi ; \quad [\text{Prop. 5}]$$

therefore $BA : BE = \text{trapezium } \Delta E : \text{trapezium } KE$.^a

Similarly it may be proved that

$$AB : BZ = \Sigma Z : \Lambda Z,$$

$$AB : BH = TH : MH,$$

$$AB : BI = YI : NI.$$

Therefore, since ΔE is a trapezium with right angles

^a For $BA = B\Gamma$ and $\Delta E : KE = \Sigma E : E\Phi$.

μὲν ποτὶ τοῖς Β, Ε ὁμαλείοις γωνίας ὀρθὰς ἔχον,
 τὰς δὲ πλευρὰς ἐπὶ τὸ Γ νεύουσας, ἰσορροπεῖ δέ
 τι χωρίον αὐτῶ τὸ Ρ κρεμάμενον ἐκ τοῦ ζυγοῦ
 κατὰ τὸ Α οὕτως ἔχοντος τοῦ τραπέζιου, ὥς νῦν
 κεῖται, καὶ ἔστιν, ὥς ἂ ΒΑ ποτὶ τὰν ΒΕ, οὕτως
 τὸ ΔΕ τραπέζιον ποτὶ τὸ ΚΕ, μείζον ἄρα ἐστὶν
 τὸ ΚΕ χωρίον τοῦ Ρ χωρίου· δέδεικται γὰρ τοῦτο.
 πάλιν δὲ καὶ τὸ ΖΣ τραπέζιον τὰς μὲν ποτὶ τοῖς
 Ζ, Ε γωνίας ὀρθὰς ἔχον, τὰν δὲ ΣΤ νεύουσας ἐπὶ
 τὸ Γ, ἰσορροπεῖ δὲ αὐτῶ χωρίον τὸ Χ ἐκ τοῦ ζυγοῦ
 κρεμάμενον κατὰ τὸ Α οὕτως ἔχοντος τοῦ τραπέ-
 ζιου, ὥς νῦν κεῖται, καὶ ἔστιν, ὥς μὲν ἂ ΑΒ ποτὶ
 τὰν ΒΕ, οὕτως τὸ ΖΣ τραπέζιον ποτὶ τὸ ΖΦ, ὥς

 τρίγωνον ἔλασσόν ἐστιν ἢ τριπλάσιον τῶν ΚΕ,
 ΛΖ, ΜΗ, ΝΙ τραπέζιων καὶ τοῦ ΕΙΓ τριγώνου.
 πάλιν, ἐπεὶ τὸ μὲν ΖΦ τραπέζιον ἔλασσόν ἐστι
 τοῦ Χ χωρίου, τὸ δὲ ΘΗ τοῦ Ψ, τὸ δὲ ΙΠ τοῦ Ω,
 τὸ δὲ ΙΟΓ τρίγωνον τοῦ Δ, φανερόν, ὅτι καὶ πάντα

ARCHIMEDES

at the points B, E and with sides converging on Γ , and it balances the area P suspended from the balance at A, if the trapezium be in its present position, while

$$BA : BE = \Delta E : KE,$$

therefore $KE > P$;

for this has been proved [Prop. 10]. Again, since Z Σ is a trapezium with right angles at the points Z, E and with ΣT converging on Γ , and it balances the area X suspended from the balance at A, if the trapezium be in its present position, while

$$AB : BE = Z\Sigma : Z\Phi,$$

$$AB : BZ = Z\Sigma : \Lambda Z,$$

therefore $\Lambda Z > X > Z\Phi$;

for this also has been proved [Prop. 12]. By the same reasoning

$$MH > \Psi > \Theta H,$$

and $NOIH > \Omega > \Pi I,$

and similarly $\Xi I\Gamma > \Delta > \Gamma IO.$

Then, since $KE > P$, $\Lambda Z > X$, $MH > \Psi$, $NI > \Omega$, $\Xi I\Gamma > \Delta$, it is clear that the sum of the aforesaid areas is greater than the area $P + X + \Psi + \Omega + \Delta$. But

$$P + X + \Psi + \Omega + \Delta = \frac{1}{3} B\Gamma\Delta; \quad [\text{Prop. 6}]$$

it is therefore plain that

$$B\Gamma\Delta < 3(KE + \Lambda Z + MH + NI + \Xi I\Gamma).$$

Again, since $Z\Phi < X$, $\Theta H < \Psi$, $\Pi I < \Omega$, $IO\Gamma < \Delta$, it is

τὰ εἰρημένα ἐλάσσονά ἐστι τοῦ $\Delta\Omega\Psi\chi$ χωρίου·
φανερὸν οὖν, ὅτι καὶ τὸ $B\Delta\Gamma$ τρίγωνον μείζον
ἐστὶν ἢ τριπλάσιον τῶν ΨZ , ΘH , ΠI τραπεζίων
καὶ τοῦ $I\Gamma O$ τριγώνου, ἔλασσον δὲ ἢ τριπλάσιον
τῶν προγεγραμμένων.

Ibid., Prop. 24, Archim. ed. Heiberg II. 312. 2-314. 27

Πᾶν τμᾶμα τὸ περιεχόμενον ὑπὸ εὐθείας καὶ
ὀρθογωνίου κώνου τομᾶς ἐπίτритόν ἐστὶ τριγώνου
τοῦ τὰν αὐτὰν βάσιν ἔχοντος αὐτῷ καὶ ὕψος ἴσον.

Ἐστω γὰρ τὸ $A\Delta B E \Gamma$ τμᾶμα περιεχόμενον ὑπὸ
εὐθείας καὶ ὀρθογωνίου κώνου τομᾶς, τὸ δὲ $A B \Gamma$
τρίγωνον ἔστω τὰν αὐτὰν βάσιν ἔχον τῷ τμᾶματι

καὶ ὕψος ἴσον, τοῦ δὲ $A B \Gamma$ τριγώνου ἔστω ἐπί-
τритον τὸ K χωρίον. δεικτέον, ὅτι ἴσον ἐστὶ τῷ
 $A\Delta B E \Gamma$ τμᾶματι.

Εἰ γὰρ μὴ ἐστὶν ἴσον, ἤτοι μείζον ἐστὶν ἢ ἔλασσον.
ἔστω πρότερον, εἰ δυνατόν, μείζον τὸ $A\Delta B E \Gamma$
τμᾶμα τοῦ K χωρίου. ἐνέγραψα δὴ τὰ $A\Delta B$,
 $B E \Gamma$ τρίγωνα, ὡς εἴρηται, ἐνέγραψα δὲ καὶ εἰς τὰ
περιλειπόμενα τμᾶματα ἄλλα τρίγωνα τὰν αὐτὰν
238

ARCHIMEDES

clear that the sum of the aforesaid areas is greater than the area $\Delta + \Omega + \Psi + X$;

it is therefore manifest that

$$B\Delta\Gamma > 3(\Phi Z + \Theta H + \text{III} + \text{I}\Gamma\text{O}),^a$$

but is less than thrice the aforementioned areas.^b

Ibid., Prop. 24, Archim. ed. Heiberg ii. 312. 2-314. 27

Any segment bounded by a straight line and a section of a right-angled cone is four-thirds of the triangle having the same base and equal height.

For let $A\Delta BE\Gamma$ be a segment bounded by a straight line and a section of a right-angled cone, and let $\Delta BF\Gamma$ be a triangle having the same base as the segment and equal height, and let the area K be four-thirds of the triangle $\Delta BF\Gamma$. It is required to prove that it is equal to the segment $A\Delta BE\Gamma$.

For if it is not equal, it is either greater or less. Let the segment $A\Delta BE\Gamma$ first be, if possible, greater than the area K . Now I have inscribed the triangles $A\Delta B$, $BE\Gamma$, as aforesaid,^c and I have inscribed in the remaining segments other triangles having the same

^a For $B\Delta\Gamma = 3(P + X + \Psi + \Omega + \Delta) > 3(\Delta + \Omega + \Psi + X)$.

^b In Prop. 15 Archimedes shows that the same theorem holds good even if $B\Gamma$ is not at right angles to the axis. It is then proved in Prop. 16, by the method of exhaustion, that the segment is equal to one-third of the triangle $B\Gamma\Delta$. This is done by showing, on the basis of the "Axiom of Archimedes," that by taking enough parts the difference between the circumscribed and the inscribed figures can be made as small as we please. It is equivalent to integration. From this it is easily proved that the segment is equal to four-thirds of a triangle with the same base and equal height (Prop. 17).

^c In earlier propositions Archimedes has used the same procedure as he now describes. Δ , E are the points in which the diameter through the mid-points of AB , $B\Gamma$ meet the curve.

βάσιν ἔχοντα τοῖς τριμάρτεσσιν καὶ ὕψος τὸ αὐτό, καὶ ἀεὶ εἰς τὰ ὕστερον γινόμενα τμήματα ἐγγράφω δύο τρίγωνα τὰν αὐτὰν βάσιν ἔχοντα τοῖς τριμάρτεσσιν καὶ ὕψος τὸ αὐτό· ἐσσοῦνται δὴ τὰ καταλειπόμενα τμήματα ἐλάσσονα τᾶς ὑπεροχῆς, ᾧ ὑπερέχει τὸ ΑΔΒΕΓ τμήμα τοῦ Κ χωρίου. ὥστε τὸ ἐγγραφόμενον πολύγωνον μείζον ἐσσεῖται τοῦ Κ· ὅπερ ἀδύνατον. ἐπεὶ γάρ ἐστιν ἐξῆς κείμενα χωρία ἐν τῷ τετραπλασίονι λόγῳ, πρῶτον μὲν τὸ ΑΒΓ τρίγωνον τετραπλάσιον τῶν ΑΔΒ, ΒΕΓ τριγώνων, ἔπειτα δὲ αὐτὰ ταῦτα τετραπλάσια τῶν εἰς τὰ ἐπόμενα τμήματα ἐγγραφέντων καὶ ἀεὶ οὕτω, δῆλον, ὡς σύμπαντα τὰ χωρία ἐλάσσονά ἐστιν ἢ ἐπίτριτα τοῦ μεγίστου, τὸ δὲ Κ ἐπίτριτόν ἐστι τοῦ μεγίστου χωρίου. οὐκ ἄρα ἐστὶν μείζον τὸ ΑΔΒΕΓ τμήμα τοῦ Κ χωρίου.

Ἐστω δέ, εἰ δυνατόν, ἔλασσον. κείσθω δὴ τὸ μὲν ΑΒΓ τρίγωνον ἴσον τῷ Ζ, τοῦ δὲ Ζ τέταρτον τὸ Η, καὶ ὁμοίως τοῦ Η τὸ Θ, καὶ ἀεὶ ἐξῆς τιθέσθω, ἕως κα γένηται τὸ ἔσχατον ἔλασσον τᾶς

^a This was proved geometrically in Prop. 23, and is proved generally in Eucl. ix. 35. It is equivalent to the summation

$$1 + \left(\frac{1}{4}\right) + \left(\frac{1}{4}\right)^2 + \dots + \left(\frac{1}{4}\right)^{n-1} = \frac{1 - \left(\frac{1}{4}\right)^n}{1 - \frac{1}{4}}$$

ARCHIMEDES

base as the segments and equal height, and so on continually, I inscribe in the resulting segments two

triangles having the same base as the segments and equal height; then there will be left [at some time] segments less than the excess by which the segment $A\Delta BE\Gamma$ exceeds the area K [Prop. 20, coroll.]. Therefore the inscribed polygon will be greater than K ; which is impossible. For since the areas successively formed are each four times as great as the next, the triangle $AB\Gamma$ being four times the triangles $A\Delta B$, $BE\Gamma$ [Prop. 21], then these last triangles four times the triangles inscribed in the succeeding segments, and so on continually, it is clear that the sum of all the areas is less than four-thirds of the greatest [Prop. 23],^a and K is equal to four-thirds of the greatest area. Therefore the segment $A\Delta BE\Gamma$ is not greater than the area K .

Now let it be, if possible, less. Then let

$$Z = AB\Gamma, H = \frac{1}{4}Z, \theta = \frac{1}{4}H,$$

and so on continually, until the last [area] is less than

ὑπεροχᾶς, ἃ ὑπερέχει τὸ Κ χωρίον τοῦ τμήματος, καὶ ἔστω ἑλαυσσον τὸ Ι. ἔστιν δὴ τὰ Ζ, Η, Θ, Ι χωρία καὶ τὸ τρίτον τοῦ Ι ἐπίτριτα τοῦ Ζ. ἔστιν δὲ καὶ τὸ Κ τοῦ Ζ ἐπίτριτον· ἴσον ἄρα τὸ Κ τοῖς Ζ, Η, Θ, Ι καὶ τῷ τρίτῳ μέρει τοῦ Ι. ἐπεὶ οὖν τὸ Κ χωρίον τῶν μὲν Ζ, Η, Θ, Ι χωρίων ὑπερέχει ἐλάσσονι τοῦ Ι, τοῦ δὲ τμήματος μείζονι τοῦ Ι, δῆλον, ὡς μείζονά ἐντι τὰ Ζ, Η, Θ, Ι χωρία τοῦ τμήματος· ὅπερ ἀδύνατον· ἐδείχθη γάρ, ὅτι, ἐὰν ἢ ὅποσαοῦν χωρία ἐξῆς κείμενα ἐν τετραπλασίονι λόγῳ, τὸ δὲ μέγιστον ἴσον ἢ τῷ εἰς τὸ τμήμα ἐγγραφομένῳ τριγώνῳ, τὰ σύμπαντα χωρία ἐλάσσονα ἐσσεύεται τοῦ τμήματος. οὐκ ἄρα τὸ ΑΔΒΕΓ τμήμα ἔλασσόν ἐστι τοῦ Κ χωρίου. ἐδείχθη δέ, ὅτι οὐδὲ μείζον· ἴσον ἄρα ἐστὶν τῷ Κ. τὸ δὲ Κ χωρίον ἐπίτριτόν ἐστι τοῦ τριγώνου τοῦ ΑΒΓ· καὶ τὸ ΑΔΒΕΓ ἄρα τμήμα ἐπίτριτόν ἐστι τοῦ ΑΒΓ τριγώνου.

* The Greek text of the book *On Floating Bodies*, the earliest extant treatise on hydrostatics, first became available in 1906 when Heiberg discovered at Constantinople the ms. which he terms C. Unfortunately many of the readings are doubtful, and those who are interested in the text should consult the Teubner edition. Still more unfortunately, it is incomplete; but, as the whole treatise was translated into Latin in 1269 by William of Moerbeke from a Greek ms.

ARCHIMEDES

the excess by which the area K exceeds the segment [Eucl. x. 1], and let I be [the area] less [than this excess]. Now

$$Z + H + \Theta + I + \frac{1}{3}I = \frac{4}{3}Z. \quad [\text{Prop. 23}]$$

But $K = \frac{4}{3}Z$;

therefore $K = Z + H + \Theta + I + \frac{1}{3}I$.

Therefore since the area K exceeds the areas Z, H, Θ, I by an excess less than I , and exceeds the segment by an excess greater than I , it is clear that the areas Z, H, Θ, I are greater than the segment; which is impossible; for it was proved that, if there be any number of areas in succession such that each is four times the next, and the greatest be equal to the triangle inscribed in the segment, then the sum of the areas will be less than the segment [Prop. 22]. Therefore the segment $A\Delta BE\Gamma$ is not less than the area K . And it was proved not to be greater; therefore it is equal to K . But the area K is four-thirds of the triangle $AB\Gamma$; and therefore the segment $A\Delta BE\Gamma$ is four-thirds of the triangle $AB\Gamma$.

(i.) *Postulates*

Archimedes, *On Floating Bodies* * i., Archim. ed.
Heiberg ii. 318. 2-8

Let the nature of a fluid be assumed to be such that, of its parts which lie evenly and are continuous, since lost, it is possible to supply the missing parts in Latin, as is done for part of Prop. 2. From a comparison with the Greek, where it survives, William's translation is seen to be so literal as to be virtually equivalent to the original. In each case Heiberg's figures are taken from William's translation, as they are almost unrecognizable in C; for convenience in reading the Greek, the figures are given the appropriate Greek letters in this edition.

ARCHIMEDES

curve $AB\Gamma\Delta$ will not be equal. Let there be taken, therefore, any straight line which is greater than some of the straight lines drawn from K to the curve $AB\Gamma\Delta$, but less than others, and with centre K and radius equal to the straight line so taken let a circle be described; the circumference of the circle will fall partly outside the curve $AB\Gamma\Delta$, partly inside, inasmuch as its radii are greater than some of the straight lines drawn from K to the curve $AB\Gamma\Delta$, but less than others. Let the arc of the circle so described be ZBH , and from B let a straight line be drawn to K , and let ZK , KEA be drawn making equal angles [with KB], and with centre K let there be described, in the plane and in the fluid, an arc $\Xi O\Gamma$; then the parts of the fluid along $\Xi O\Gamma$ lie evenly and are continuous [*v. supra*, p. 243]. And the parts along the arc ΞO are under pressure from the portion of the fluid between it and ZB , while the parts along the arc $O\Gamma$ are under pressure from the portion of the fluid between it and BE ; therefore the parts of the fluid along ΞO and the parts of the fluid along $O\Gamma$ are under unequal pressures; so that the parts under the lesser pressure are thrust along by the parts under the greater pressure [*v. supra*, p. 245]; therefore the fluid will not remain at rest. But it was postulated that the fluid would remain unmoved; therefore the curve $AB\Gamma\Delta$ must be an arc of a circle with centre K . Similarly it may be shown that, in whatever other manner the surface be cut by a plane through the centre of the earth, the section is an arc of a circle and its centre will also be the centre of the earth. It is therefore clear that the surface of the fluid remaining at rest has the form of a sphere with the same centre as the earth, since it is such

τοιαύτα ἐστίν, ὥστε διὰ τοῦ αὐτοῦ σαμείου τμαθεῖσαν τὰν τομὰν ποιεῖν περιφέρειαν κύκλου κέντρον ἔχοντος τὸ σαμεῖον, δι' οὗ τέμνεται τῷ ἐπιπέδῳ.

Ibid. i., Prop. 7, Archim. ed. Heiberg ii. 332. 21-336. 13

Τὰ βαρύτερα τοῦ ὑγροῦ ἀφελέντα εἰς τὸ ὑγρὸν οἰσεῖται κάτω, ἔστ' ἂν καταβᾶντι, καὶ ἐσσοῦνται κουφότερα ἐν τῷ ὑγρῷ τοσοῦτον, ὅσον ἔχει τὸ βάρος τοῦ ὑγροῦ τοῦ ταλικοῦτον ὄγκον ἔχοντος, ἀλίκος ἐστὶν ὁ τοῦ στερεοῦ μεγέθους ὄγκος.

“Ὅτι μὲν οὖν οἰσεῖται ἐς τὸ κάτω, ἔστ' ἂν καταβᾶντι, δῆλον· τὰ γὰρ ὑποκάτω αὐτοῦ μέρεα τοῦ ὑγροῦ θλιβησοῦνται μᾶλλον τῶν ἐξ ἴσου αὐτοῖς κειμένων μερέων, ἐπεὶ δὲ βαρύτερον ὑπόκειται τὸ στερεὸν μέγεθος τοῦ ὑγροῦ· ὅτι δὲ κουφότερα ἐσσοῦνται, ὡς εἴρηται, δειχθήσεται.

Ἐστω τι μέγεθος τὸ Α, ὃ ἐστὶ βαρύτερον τοῦ ὑγροῦ, βάρος δὲ ἔστω τοῦ μὲν ἐν ψ Α μεγέθους τὸ ΒΓ, τοῦ δὲ ὑγροῦ τοῦ ἴσον ὄγκον ἔχοντος τῷ Α τὸ Β. δεικτέον, ὅτι τὸ Α μέγεθος ἐν τῷ ὑγρῷ ἐὼν βάρος ἔξει ἴσον τῷ Γ.

Λελάφθω γάρ τι μέγεθος τὸ ἐν ψ τὸ Δ κουφότερον τοῦ ὑγροῦ τοῦ ἴσον ὄγκον ἔχοντος αὐτῷ, ἔστω δὲ τοῦ μὲν ἐν ψ τὸ Δ μεγέθους βάρος ἴσον τῷ Β βάρει, τοῦ δὲ ὑγροῦ τοῦ ἴσον ὄγκον ἔχοντος τῷ Δ μεγέθει τὸ βάρος ἔστω ἴσον τῷ ΒΓ βάρει.

^a Or, as we should say, “lighter by the weight of fluid displaced.”

ARCHIMEDES

that, when it is cut [by a plane] always passing through the same point, the section is an arc of a circle having for centre the point through which it is cut by the plane [Prop. 1].

(iii.) *Solid immersed in a Fluid*

Ibid. i., Prop. 7, Archim. ed. Heiberg ii. 332. 21-336. 13

Solids heavier than a fluid will, if placed in the fluid, sink to the bottom, and they will be lighter [if weighed] in the fluid by the weight of a volume of the fluid equal to the volume of the solid.^a

That they will sink to the bottom is manifest ; for the parts of the fluid under them are under greater pressure than the parts lying evenly with them, since it is postulated that the solid is heavier than water ; that they will be lighter, as aforesaid will be [thus] proved.

Let A be any magnitude heavier than the fluid, let the weight of the magnitude A be $B + \Gamma$, and let the weight of fluid having the same volume as A be B. It is required to prove that in the fluid the magnitude A will have a weight equal to Γ .

For let there be taken any magnitude Δ lighter than the same volume of the fluid such that the weight of the magnitude Δ is equal to the weight B, while the weight of the fluid having the same volume as the magnitude Δ is equal to the weight $B + \Gamma$.

συντεθέντων δὴ ἐς τὸ αὐτὸ τῶν μεγεθέν, ἐν οἷς τὰ A, Δ , τὸ τῶν συναμφοτέρων μέγεθος ἰσοβαρὲς ἐσσεύεται τῷ ὑγρῷ· ἔστι γὰρ τῶν μεγεθέν συναμφοτέρων τὸ βάρος ἴσον συναμφοτέροις τοῖς βάρεσιν τῷ τε $B\Gamma$ καὶ τῷ B , τοῦ δὲ ὑγροῦ τοῦ ἴσον ὄγκον ἔχοντος ἀμφοτέροις τοῖς μεγέθεσι τὸ βάρος ἴσον ἐστὶ τοῖς αὐτοῖς βάρεσιν. ἀφεθέντων οὖν τῶν μεγεθέν ἐς τὸ ὑγρὸν ἰσορροπησοῦνται τῷ ὑγρῷ καὶ οὔτε εἰς τὸ ἄνω οἰσοῦνται οὔτε εἰς τὸ κάτω· διὸ τὸ μὲν ἐν ψ A μέγεθος οἰσεύεται ἐς τὸ κάτω καὶ τοσαύτα βία ὑπὸ τοῦ ἐν ψ Δ μεγέθεος ἀνέλκεται ἐς τὸ ἄνω, τὸ δὲ ἐν ψ Δ μέγεθος, ἐπεὶ κουφότερόν ἐστι τοῦ ὑγροῦ, ἀνοισεύεται εἰς τὸ ἄνω τοσαύτα βία, ὅσον ἐστὶ τὸ Γ βάρος· δέδεικται γάρ, ὅτι τὰ κουφότερα τοῦ ὑγροῦ μεγέθεα στερεὰ βιασθέντα ἐς τὸ ὑγρὸν ἀναφέρονται τοσαύτα βία ἐς τὸ ἄνω, ὅσον ἐστὶ τὸ βάρος, ψ βαρύτερόν ἐστι τοῦ μεγέθεος τὸ ὑγρὸν τὸ ἴσογκον τῷ μεγέθει. ἔστι δὲ τῷ Γ βάρει βαρύτερον τοῦ Δ μεγέθεος τὸ ὑγρὸν τὸ ἴσον ὄγκον ἔχον τῷ Δ · δῆλον οὖν, ὅτι καὶ τὸ ἐν ψ A μέγεθος ἐς τὸ κάτω οἰσεύεται τοσούτῳ βάρει, ὅσον ἐστὶ τὸ Γ .

^a This proposition suggests a method, alternative to that given by Vitruvius (*v. supra*, pp. 36-39, especially p. 38 n. *a*), whereby Archimedes may have discovered the proportions of gold and silver in King Hiero's crown.

Let w be the weight of the crown, and let w_1 and w_2 be the weights of gold and silver in it respectively, so that $w = w_1 + w_2$.

Take a weight w of gold and weigh it in a fluid, and let the loss of weight be P_1 . Then the loss of weight when a weight w_1 of gold is weighed in the fluid, and consequently the weight of fluid displaced, will be $\frac{w_1}{w} \cdot P_1$.

ARCHIMEDES

Then if we combine the magnitudes A, Δ , the combined magnitude will be equal to the weight of the same volume of the fluid; for the weight of the combined magnitudes is equal to the weight $(B + \Gamma) + B$, while the weight of the fluid having the same volume as both the magnitudes is equal to the same weight. Therefore, if the [combined] magnitudes are placed in the fluid, they will balance the fluid, and will move neither upwards nor downwards [Prop. 3]; for this reason the magnitude A will move downwards, and will be subject to the same force as that by which the magnitude Δ is thrust upwards, and since Δ is lighter than the fluid it will be thrust upwards by a force equal to the weight Γ ; for it has been proved that when solid magnitudes lighter than the fluid are forcibly immersed in the fluid, they will be thrust upwards by a force equal to the difference in weight between the magnitude and an equal volume of the fluid [Prop. 6]. But the fluid having the same volume as Δ is heavier than the magnitude Δ by the weight Γ ; it is therefore plain that the magnitude A will be borne upwards by a force equal to Γ .^a

Now take a weight w of silver and weigh it in the fluid, and let the loss of weight be P_1 . Then the loss of weight when a weight w_2 of silver is weighed in the fluid, and consequently the weight of fluid displaced, will be $\frac{w_2}{w} \cdot P_1$.

Finally, weigh the crown itself in the fluid, and let the loss of weight, and consequently the weight of fluid displaced, be P .

It follows that
$$\frac{w_1}{w} \cdot P_1 + \frac{w_2}{w} \cdot P_2 = P,$$

whence

$$\frac{w_1}{w_2} = \frac{P_2 - P}{P - P_1}.$$

(iv.) *Stability of a Paraboloid of Revolution**Ibid.* ii., Prop. 2, Archim. ed. Heiberg ii. 318. 10-352. 19

Τὸ ὀρθὸν τμᾶμα τοῦ ὀρθογωνίου κωνοειδέος, ὅταν τὸν ἄξονα ἔχῃ μὴ μείζονα ἢ ἡμιόλιον τᾶς μέχρι τοῦ ἄξονος, πάντα λόγον ἔχον ποτὶ τὸ ὑγρὸν τῷ βάρει, ἀφεθὲν εἰς τὸ ὑγρὸν οὕτως, ὥστε τὰν βάσιν αὐτοῦ μὴ ἄπτεσθαι τοῦ ὑγροῦ, τεθὲν κεκλιμένον οὐ μενεῖ κεκλιμένον, ἀλλὰ ἀποκαταστασέεται ὀρθόν. ὀρθὸν δὲ λέγω καθεστακέναι τὸ τοιοῦτο τμᾶμα, ὅποταν τὸ ἀποτεφμακὸς αὐτὸ ἐπίπεδον παρὰ τὰν ἐπιφάνειαν ἦ τοῦ ὑγροῦ.

Τμαθέντος δὴ αὐτοῦ ἐπιπέδῳ διὰ τοῦ ἄξονος ὀρθῶ ποτὶ τὸ ἐπίπεδον τὸ ἐπὶ τᾶς ἐπιφανείας τοῦ ὑγροῦ τμάματος ἔστω τομὰ $\acute{\alpha}$ ΑΠΟΛ ὀρθογωνίου κώνου τομὰ, ἄξων δὲ τοῦ τμάματος καὶ διάμετρος τᾶς τομᾶς $\acute{\alpha}$ ΝΟ, τᾶς δὲ τοῦ ὑγροῦ ἐπιφανείας τομὰ $\acute{\alpha}$ ΙΣ. ἐπεὶ οὖν τὸ τμᾶμα οὐκ ἐστὶν ὀρθόν, οὐκ ἂν εἴη παράλληλος $\acute{\alpha}$ ΑΛ τῇ ΙΣ· ὥστε οὐ ποιήσει ὀρθὰν γωνίαν $\acute{\alpha}$ ΝΟ ποτὶ τὰν ΙΣ. ἄχθω

^a Writing of the treatise *On Floating Bodies*, Heath (*H.G.M.* ii. 94-95) justly says: "Book ii., which investigates fully the conditions of stability of a right segment of a paraboloid of revolution floating in a fluid for different values of the specific gravity and different ratios between the axis or height of the segment and the principal parameter of the generating parabola, is a veritable *tour de force* which must be read in full to be appreciated."

^b In this technical term the "axis" is the axis of the

ARCHIMEDES

(iv.) *Stability of a Paraboloid of Revolution* ^a

Ibid. ii., Prop. 2, Archim. ed. Heiberg ii. 348. 10-352. 19

If there be a right segment of a right-angled conoid, whose axis is not greater than one-and-a-half times the line drawn as far as the axis,^b and whose weight relative to the fluid may have any ratio, and if it be placed in the fluid in an inclined position in such a manner that its base do not touch the fluid, it will not remain inclined but will return to the upright position. I mean by returning to the upright position the figure formed when the plane cutting off the segment is parallel to the surface of the fluid.

Let there be a segment of a right-angled conoid, such as has been stated, and let it be placed in an inclined position. It is required to prove that it will not remain there but will return to the upright position.

Let the segment be cut by a plane through the axis perpendicular to the plane which forms the surface of the fluid, and let $ΑΙΘΑ$ be the section of the segment, being a section of a right-angled cone [*De Con. et Sphaer.* 11], and let $ΝΟ$ be the axis of the segment and the axis of the section, and let $ΙΣ$ be the section of the surface of the liquid. Then since the segment is not upright, $ΑΑ$ will not be parallel to $ΙΣ$; and therefore $ΝΟ$ will not make a right angle

right-angled cone from which the generating parabola is derived. The *latus rectum* is "the line which is double of the line drawn as far as the axis" (*ἡ διπλασία τῆς μέχρι τοῦ ἄξονος*); and so the condition laid down by Archimedes is that the axis of the segment of the paraboloid of revolution shall not be greater than three-quarters of the *latus rectum* or *principal parameter* of the generating parabola.

with $\text{I}\Sigma$. Therefore let $\text{K}\Omega$ be drawn parallel [to $\text{I}\Sigma$] and touching the section of the cone at Π , and from Π let $\Pi\Phi$ be drawn parallel to NO ; then $\Pi\Phi$ bisects $\text{I}\Sigma$ —for this is proved in the [*Elements of*] *Conics*.^a Let $\Pi\Phi$ be cut so that $\Pi\text{B} = 2\text{B}\Phi$, and let NO be cut at P so that $\text{OP} = 2\text{PN}$; then P will be the centre of gravity of the greater segment of the solid, and B that of $\text{IIIO}\Sigma$; for it is proved in the books *On Equilibriums* that the centre of gravity of any segment of a right-angled conoid is at the point dividing the axis in such a manner that the segment towards the vertex of the axis is double of the remainder.^b Now if the solid segment $\text{IIIO}\Sigma$ be taken away from the whole,^c the centre of gravity of the remainder will lie upon the straight line $\text{B}\Gamma$; for it has been proved in the *Elements of Mechanics* that if any magnitude be taken away not having the same centre of gravity as the whole magnitude, the centre of gravity of the remainder will be on the straight line joining the centres [of gravity] of the whole magnitude and of the part

^a Presumably in the works of Aristacus or Euclid, but it is also *Quad. Parab.* 1.

^b The proof is not in any extant work by Archimedes.

ἀφηρημένου ἐκβεβλημένας ἐπὶ τὰ αὐτά, ἐφ' ᾧ τὸ κέντρον τοῦ ὅλου μεγέθεός ἐστιν. ἐκβεβλήσθω δὴ ἡ BP ἐπὶ τὸ Γ , καὶ ἔστω τὸ Γ τὸ κέντρον τοῦ βάρους τοῦ λοιποῦ μεγέθεος. ἐπεὶ οὖν ἡ NO τῆς μὲν OP ἡμιολία, τῆς δὲ μέχρι τοῦ ἄξονος οὐ μείζων ἢ ἡμιολία, δηλόν, ὅτι ἡ PO τῆς μέχρι τοῦ ἄξονος οὐκ ἐστὶ μείζων· ἢ PP ἄρα ποτὶ τὰν $K\Omega$ γωνίας ἀνίσους ποιεῖ, καὶ ἡ ὑπὸ τῶν $P\Omega$ γίνεται ὀξεῖα· ἡ ἀπὸ τοῦ P ἄρα κάθετος ἐπὶ τὰν Ω ἀγομμένα μεταξὺ πεσεῖται τῶν Π , Ω . πιπτέτω ὡς ἡ $P\Theta$. ἡ $P\Theta$ ἄρα ὀρθά ἐστιν ποτὶ τὸ <ἀποτετμακός>¹ ἐπίπεδον, ἐν ᾧ ἐστὶν ἡ $\Sigma\Xi$, ὃ ἐστὶν ἐπὶ τῆς ἐπιφανείας τοῦ ὕγρου. ἄχθωσαν δὴ τινες ἀπὸ τῶν B , Γ παρὰ τὰν $P\Theta$ ἐνεχθήσεται δὴ τὸ μὲν ἐκτὸς τοῦ ὕγρου τοῦ μεγέθεος εἰς τὸ κάτω κατὰ τὰν διὰ τοῦ Γ ἀγομέναν κάθετον· ὑπόκειται γὰρ ἕκαστον τῶν βαρέων εἰς τὸ κάτω φέρεσθαι κατὰ τὰν κάθετον τὰν διὰ τοῦ κέντρου ἀγομέναν· τὸ δὲ ἐν τῷ ὕγρῳ μέγεθος, ἐπεὶ κουφότερον γίνεται τοῦ ὕγρου, ἐνεχθήσεται εἰς τὸ ἄνω κατὰ τὰν κάθετον τὰν διὰ τοῦ B ἀγομέναν. ἐπεὶ δὲ οὐ κατὰ τὰν αὐτὰν κάθετον ἀλλάλοις ἀντιθλίβονται, οὐ μενεῖ τὸ σχῆμα, ἀλλὰ τὰ μὲν κατὰ τὸ A εἰς τὸ ἄνω ἐνεχθήσεται, τὰ δὲ κατὰ τὸ Λ εἰς τὸ κάτω, καὶ τοῦτο αἰεὶ ἐσσεῖται, ἕως ἂν ὀρθὸν ἀποκατασταθῇ.

¹ ἀποτετμακός, cf. *supra*, p. 252 line 8; Heiberg prints κ . . . $\sigma\varsigma$.

^a If the normal at Π meets the axis in M , then OM is greater than "the line drawn as far as the axis" except in the case where Π coincides with the vertex, which case is excluded by the conditions of this proposition. Hence OM is always greater than OP ; and because the angle $\Omega M M$ is right, the angle $\Omega P P$ must be acute.

ARCHIMEDES

taken away, produced from the extremity which is the centre of gravity of the whole magnitude [*De Plan. Aequil.* i. 8]. Let BP then be produced to Γ , and let Γ be the centre of gravity of the remaining magnitude. Then, since $NO = \frac{3}{5} \cdot OP$, and $NO \div \frac{3}{5}$ (the line drawn as far as the axis), it is clear that $PO \div$ (the line drawn as far as the axis); therefore ΠP makes unequal angles with $K\Omega$, and the angle $\Pi\Omega$ is acute^a; therefore the perpendicular drawn from P to $\Pi\Omega$ will fall between Π , Ω . Let it fall as $P\Theta$; then $P\Theta$ is perpendicular to the cutting plane containing ΣI , which is on the surface of the fluid. Now let lines be drawn from B, Γ parallel to $P\Theta$; then the portion of the magnitude outside the fluid will be subject to a downward force along the line drawn through Γ —for it is postulated that each weight is subject to a downward force along the perpendicular drawn through its centre of gravity^b; and since the magnitude in the fluid is lighter than the fluid,^c it will be subject to an upward force along the perpendicular drawn through B.^d But, since they are not subject to contrary forces along the same perpendicular, the figure will not remain at rest but the portion on the side of A will move upwards and the portion on the side of Λ will move downwards, and this will go on continually until it is restored to the upright position.

^b Cf. *supra*, p. 245; possibly a similar assumption to this effect has fallen out of the text.

^c A tacit assumption, which limits the generality of the opening statement of the proposition that the segment may have any weight relative to the fluid.

^d v. *supra*, p. 251.

² Βῆτα Gloss. in Psalmos, Hesych. Mil., τὰ βήματα codd.

^a Several of Eratosthenes' achievements have already been described—his solution of the Delian problem (vol. pp. 290-297), and his *siege* for finding successive odd numbers (vol. i. pp. 100-103). Archimedes, as we have seen, dedicate the *Method* to him, and the *Cattle Problem*, as we have also seen, is said to have been sent through him to the Alexandria mathematicians. It is generally supposed that Ptolemy credits him with having calculated the distance between the tropics (or twice the obliquity of the ecliptic) at 11/83rds. of a complete circle or 47° 29' 39", but Ptolemy's meaning is not clear. Eratosthenes also calculated the distances of the sun and moon from the earth and the size of the sun. Fragment of an astronomical poem which he wrote under the title

XVIII. ERATOSTHENES ^a

(a) GENERAL

Suidas, *s.v.* *Eratosthenes*

ERATOSTHENES, son of Aglaus, others say of Ambrosius; a Cyrenean; a pupil of the philosopher Ariston of Chios, of the grammarian Lysanias of Cyrene and of the poet Callimachus ^b; he was sent for from Athens by the third Ptolemy ^c and stayed till the fifth.^d Owing to taking second place in all branches of learning, though approaching the highest excellence, he was called *Beta*. Others called him a *Second* or *New Plato*, and yet others *Pentathlon*. He was born in the 126th Olympiad ^e and died at the age

Hermes have survived. He was the first person to attempt a scientific chronology from the siege of Troy in two separate works, and he wrote a geographical work in three books. His writings are critically discussed in Bernhardt's *Eratosthenica* (Berlin, 1822).

^b Callimachus, the famous poet and grammarian, was also a Cyrenean. He opened a school in the suburbs of Alexandria and was appointed by Ptolemy Philadelphus chief librarian of the Alexandrian library, a post which he held till his death c. 240 B.C. Eratosthenes later held the same post.

^c Euergetes I (reigned 246–221 B.C.), who sent for him to be tutor to his son and successor Philopator (v. vol. i. pp. 256, 296).

^d Epiphanes (reigned 204–181 B.C.).

^e 276–273 B.C.

(c) THE "PLATONICUS"

Theon Smyr., ed. Hiller 81. 17-82. 5

Ἑρατοσθένης δὲ ἐν τῷ Πλατωνικῷ φησι, μὴ ταῦτόν εἶναι διάστημα καὶ λόγον. ἐπειδὴ λόγος μὲν ἐστὶ δύο μεγεθῶν ἢ πρὸς ἄλληλα ποιά σχέσις, γίνεται δ' αὕτη καὶ ἐν διαφόροις <καὶ ἐν ἀδιαφόροις>.² οἷον ἐν ᾧ λόγῳ ἐστὶ τὸ αἰσθητὸν πρὸς τὸ νοητόν, ἐν τούτῳ δόξα πρὸς ἐπιστήμην, καὶ διαφέρει καὶ τὸ νοητόν τοῦ ἐπιστητοῦ ᾧ καὶ ἡ δόξα τοῦ αἰσθητοῦ. διάστημα δὲ ἐν διαφέρουσι μόνον, ἢ κατὰ τὸ μέγεθος ἢ κατὰ ποιότητά ἢ κατὰ θέσιν ἢ ἄλλως ὅπως οὖν. δῆλον δὲ καὶ ἐντεῦθεν,

¹ The passage of which this forms the concluding sentence is attributed by Hultsch to an interpolator. To fill the lacuna before ἐκείνοις he suggests ἀνόμοιοι ἐκείνοις, following Halley's rendering, "diversa sunt ab illis."

² καὶ ἐν ἀδιαφόροις add. Hiller.

^a Tannery conjectured that these were the loci of points such that their distances from three fixed lines provided a "médieté," i.e., loci (straight lines and conics) which can be represented in trilinear co-ordinates by such equations as

$$2y = x + z, y^2 = xz, y(x + z) = 2xz, x(x - y) = z(y - z), \\ x(x - y) = y(y - z);$$

these represent respectively the arithmetic, geometric and harmonic means, and the means subcontrary to the harmonic and geometric means (v. vol. i. pp. 122-125). Zeuthen has

ERATOSTHENES

when it is said that the locus of a point is a surface and the locus of a line is a solid. [. . . the loci described by Eratosthenes as having reference to means belong to one of the aforesaid classes, but from a peculiarity in the assumptions are unlike them.]^a

(c) THE " PLATONICUS "

Theon of Smyrna, ed. Hiller 81. 17-82. 5

Eratosthenes in the *Platonicus*^b says that *interval* and *ratio* are not the same. Inasmuch as a ratio is a sort of relationship of two magnitudes one towards the other,^c there exists a ratio both between terms that are different and also between terms that are not different. For example, the ratio of the perceptible to the intelligible is the same as the ratio of opinion to knowledge, and the difference between the intelligible and the known is the same as the difference of opinion from the perceptible.^d But there can be an interval only between terms that are different, according to magnitude or quality or position or in some other way. It is thence clear that ratio is

an alternative conjecture on similar lines (*Die Lehre von den Kegelschnitten im Altertum*, pp. 320-321).

^b Theon cites this work in one other passage (ed. Hiller 2. 3-12) telling how Plato was consulted about the doubling of the cube; it has already been cited (vol. i. p. 256). Eratosthenes' own solution of the problem has already been given in vol. i. pp. 290-297, and a letter purporting to be from Eratosthenes to Ptolemy Euergetes is given in vol. i. pp. 256-261. Whether the *Platonicus* was a commentary on Plato or a dialogue in which Plato was an interlocutor cannot be decided.

^c Cf. Eucl. v. Def. 3, cited in vol. i. p. 444.

^d A reference to Plato, *Rep.* vi. 509 D—511 E, vii. 517 A—518 B.

(d) MEASUREMENT OF THE EARTH

Cleom. *De motu circ.* i. 10. 52, ed. Ziegler 94. 23-100. 23

Καὶ ἡ μὲν τοῦ Ποσειδωνίου ἔφοδος περὶ τοῦ κατὰ τὴν γῆν μεγέθους τοιαύτη, ἡ δὲ τοῦ Ἑρατοσθένους γεωμετρικῆς ἐφόδου ἐχομένη, καὶ δοκούσά τι ἀσαφέστερον ἔχειν. ποιήσει δὲ σαφῆ τὰ λεγόμενα ὑπ' αὐτοῦ τάδε προϋποτιθεμένων ἡμῶν. ὑποκείσθω ἡμῖν πρῶτον μὲν κἀνταῦθα, ὑπὸ τῷ αὐτῷ μεσημβρινῷ κεῖσθαι Σύνηνη καὶ Ἀλεξάνδρειαν, καὶ δεύτερον, τὸ διάστημα τὸ μεταξὺ τῶν πόλεων πεντακισχιλίων σταδίων εἶναι, καὶ τρίτον, τὰς καταπεμπομένας ἀκτῖνας ἀπὸ διαφόρων μερῶν τοῦ ἡλίου ἐπὶ διάφορα τῆς γῆς μέρη παραλλήλους εἶναι· οὕτως γὰρ ἔχειν αὐτάς οἱ γεωμέτραι ὑποτίθενται. τέταρτον ἐκείνο ὑποκείσθω, δεικνύμενον παρὰ τοῖς γεωμέτραις, τὰς εἰς παραλλήλους ἐμπιπτούσας εὐθείας τὰς ἐναλλάξ γωνίας ἴσας ποιεῖν, πέμπτον, τὰς ἐπὶ ἴσων γωνιῶν βεβηκυίας περιφερείας ὁμοίας εἶναι, τουτέστι τὴν αὐτὴν ἀναλογίαν καὶ τὸν αὐτὸν λόγον ἔχειν πρὸς τοὺς οἰκείους κύκλους, δεικνυμένου καὶ τούτου παρὰ τοῖς γεωμέτραις. ὁπόταν γὰρ περιφέρειαι ἐπὶ ἴσων γωνιῶν ὦσι βεβηκυῖαι, ἂν μία ἥτισοῦν

¹ καὶ . . . ἡμῖσι add. Hiller.

^a The difference between ratio and interval is explained a little more neatly by Theon himself (ed. Hiller 81. 6-9):
266

ERATOSTHENES

different from interval ; for the relationship of the half to the double and of the double to the half does not furnish the same ratio, but it does furnish the same interval.^a

(d) MEASUREMENT OF THE EARTH

Cleomedes,^b *On the Circular Motion of the Heavenly Bodies* i. 10. 52, ed. Ziegler 94. 23-100. 23

Such then is Posidonius's method of investigating the size of the earth, but Eratosthenes' method depends on a geometrical argument, and gives the impression of being more obscure. What he says will, however, become clear if the following assumptions are made. Let us suppose, in this case also, first that Syene and Alexandria lie under the same meridian circle ; secondly, that the distance between the two cities is 5000 stades ; and thirdly, that the rays sent down from different parts of the sun upon different parts of the earth are parallel ; for the geometers proceed on this assumption. Fourthly, let us assume that, as is proved by the geometers, straight lines falling on parallel straight lines make the alternate angles equal, and fifthly, that the arcs subtended by equal angles are similar, that is, have the same proportion and the same ratio to their proper circles—this also being proved by the geometers. For whenever arcs of circles are subtended by equal angles, if any one of these is (say) one-tenth

διαφέρει δὲ διάστημα καὶ λόγος, ἐπεὶ δὲ διάστημα μὲν ἐστὶ τὸ μεταξὺ τῶν ὁμογενῶν τε καὶ ἀνίσων ὄρων, λόγος δὲ ἀπλῶς ἢ τῶν ὁμογενῶν ὄρων πρὸς ἀλλήλους σχέσις.

^b Cleomedes probably wrote about the middle of the first century B.C. His handbook *De motu circulari corporum caelestium* is largely based on Posidonius.

αὐτῶν δέκατον ἢ μέρος τοῦ οἰκείου κύκλου, καὶ αἱ λοιπαὶ πᾶσαι δέκατα μέρη γενήσονται τῶν οἰκείων κύκλων.

Τούτων ὁ κατακρατήσας οὐκ ἂν χαλεπῶς τὴν ἔφοδον τοῦ Ἑρατοσθένους καταμάθοι ἔχουσιν οὕτως. ὑπὸ τῷ αὐτῷ κείσθαι μεσημβρινῷ φησι Σύνηνη καὶ Ἀλεξανδρείαν. ἐπεὶ οὖν μέγιστοι τῶν ἐν τῷ κόσμῳ οἱ μεσημβρινοί, δεῖ καὶ τοὺς ὑποκειμένους τούτοις τῆς γῆς κύκλους μεγίστους εἶναι ἀναγκαίως. ὥστε ἡλίκον ἂν τὸν διὰ Σύνηνης καὶ Ἀλεξανδρείας ἦκοντα κύκλον τῆς γῆς ἢ ἔφοδος ἀποδείξει αὕτη, τηλικούτος καὶ ὁ μέγιστος ἔσται τῆς γῆς κύκλος. φησὶ τοίνυν, καὶ ἔχει οὕτως, τὴν Σύνηνην ὑπὸ τῷ θερινῷ τροπικῷ κείσθαι κύκλῳ. ὅποτε οὖν ἐν καρκίνῳ γενόμενος ὁ ἥλιος καὶ θερινὰς ποιῶν τροπὰς ἀκριβῶς μεσουρανήσῃ, ἄσκειοι γίνονται οἱ τῶν ὥρολογίων γνώμονες ἀναγκαίως, κατὰ κάθετον ἀκριβῇ τοῦ ἡλίου ὑπερκειμένου· καὶ τοῦτο γίνεσθαι λόγος ἐπὶ σταδίους τριακοσίους τὴν διάμετρον. ἐν Ἀλεξανδρείᾳ δὲ τῇ αὐτῇ ὥρᾳ ἀποβάλλουσιν οἱ τῶν ὥρολογίων γνώμονες σκιάν, ἅτε πρὸς ἄρκτῳ μᾶλλον τῆς Σύνηνης ταύτης τῆς πόλεως κειμένης. ὑπὸ τῷ αὐτῷ μεσημβρινῷ τοίνυν καὶ μεγίστῳ κύκλῳ τῶν πόλεων κειμένων, ἂν περιαγάγωμεν περιφέρειαν ἀπὸ τοῦ ἄκρου τῆς τοῦ γνώμονος σκιᾶς ἐπὶ τὴν βάσιν αὐτὴν τοῦ γνώμονος τοῦ ἐν Ἀλεξανδρείᾳ ὥρολογίου, αὕτη ἢ περιφέρεια τμήμα γενήσεται τοῦ μεγίστου τῶν ἐν τῇ σκάφῃ κύκλων, ἐπεὶ μεγίστῳ κύκλῳ ὑπόκειται ἢ τοῦ ὥρολογίου σκάφη. εἰ οὖν ἐξῆς νοήσῃμεν εὐθείας διὰ τῆς γῆς ἐκβαλλομένας ἀφ' ἑκατέρου τῶν γνωμόνων, πρὸς τῷ κέντρῳ τῆς γῆς

ERATOSTHENES

of its proper circle, all the remaining arcs will be tenth parts of their proper circles.

Anyone who has mastered these facts will have no difficulty in understanding the method of Eratosthenes, which is as follows. Syene and Alexandria, he asserts, are under the same meridian. Since meridian circles are great circles in the universe, the circles on the earth which lie under them are necessarily great circles also. Therefore, of whatever size this method shows the circle on the earth through Syene and Alexandria to be, this will be the size of the great circle on the earth. He then asserts, as is indeed the case, that Syene lies under the summer tropic. Therefore, whenever the sun, being in the Crab at the summer solstice, is exactly in the middle of the heavens, the pointers of the sundials necessarily throw no shadows, the sun being in the exact vertical line above them; and this is said to be true over a space 300 stades in diameter. But in Alexandria at the same hour the pointers of the sundials throw shadows, because this city lies farther to the north than Syene. As the two cities lie under the same meridian great circle, if we draw an arc from the extremity of the shadow of the pointer to the base of the pointer of the sundial in Alexandria, the arc will be a segment of a great circle in the bowl of the sundial, since the bowl lies under the great circle. If then we conceive straight lines produced in order from each of the pointers through the earth, they

συμπεσούνται. ἐπεὶ οὖν τὸ ἐν Συήνῃ ὠρολόγιον κατὰ κάθετον ὑπόκειται τῷ ἡλίῳ, ἂν ἐπινοήσωμεν εὐθείαν ἀπὸ τοῦ ἡλίου ἦκουσαν ἐπ' ἄκρον τὸν τοῦ ὠρολογίου γνώμονα, μία γενήσεται εὐθεῖα ἡ ἀπὸ τοῦ ἡλίου μέχρι τοῦ κέντρου τῆς γῆς ἦκουσα. ἐὰν οὖν ἑτέραν εὐθείαν νοήσωμεν ἀπὸ τοῦ ἄκρου τῆς σκιᾶς τοῦ γνώμονος δι' ἄκρου τοῦ γνώμονος ἐπὶ τὸν ἥλιον ἀναγομένην ἀπὸ τῆς ἐν Ἀλεξανδρείᾳ σκάφης, αὕτη καὶ ἡ προειρημένη εὐθεῖα παράλληλοι γενήσονται ἀπὸ διαφόρων γε τοῦ ἡλίου μερῶν ἐπὶ διάφορα μέρη τῆς γῆς διήκουσαι. εἰς ταύτας τοίνυν παραλλήλους οὕσας ἐμπίπτει εὐθεῖα ἡ ἀπὸ τοῦ κέντρου τῆς γῆς ἐπὶ τὸν ἐν Ἀλεξανδρείᾳ γνώμονα ἦκουσα, ὥστε τὰς ἐναλλὰξ γωνίας ἴσας ποιεῖν· ὧν ἡ μὲν ἐστὶ πρὸς τῷ κέντρῳ τῆς γῆς κατὰ σύμπτωσιν τῶν εὐθειῶν, αἱ ἀπὸ τῶν ὠρολογίων ἠχθησαν ἐπὶ τὸ κέντρον τῆς γῆς, γινομένη, ἡ δὲ κατὰ σύμπτωσιν ἄκρου τοῦ ἐν Ἀλεξανδρείᾳ γνώμονος καὶ τῆς ἀπ' ἄκρου τῆς σκιᾶς αὐτοῦ ἐπὶ τὸν ἥλιον διὰ τῆς πρὸς αὐτὸν ψαύσεως ἀναχθείσης γεγεννημένη. καὶ ἐπὶ μὲν ταύτης βέβηκε περιφέρεια ἡ ἀπ' ἄκρου τῆς σκιᾶς τοῦ γνώμονος ἐπὶ τὴν βάσιν αὐτοῦ περιαχθεῖσα, ἐπὶ δὲ τῆς πρὸς τῷ κέντρῳ τῆς γῆς ἡ ἀπὸ Συήνης διήκουσα εἰς Ἀλεξανδρείαν. ὅμοιαι τοίνυν αἱ περιφέρειαι εἰσιν ἀλλήλαις ἐπ' ἴσων γε γωνιῶν βεβηκυῖαι. ὃν ἄρα λόγον ἔχει ἡ ἐν τῇ σκάφῃ πρὸς τὸν οἰκεῖον κύκλον, τοῦτον ἔχει τὸν λόγον καὶ ἡ ἀπὸ Συήνης εἰς Ἀλεξανδρείαν ἦκουσα. ἡ δὲ γε ἐν τῇ σκάφῃ πεντηκοστὸν μέρος εὐρίσκεται τοῦ οἰκείου κύκλου. δεῖ οὖν ἀναγκαίως καὶ τὸ ἀπὸ Συήνης εἰς Ἀλεξανδρείαν διάστημα πεντηκοστὸν εἶναι μέρος τοῦ

ERATOSTHENES

will meet at the centre of the earth. Now since the sundial at Syene is vertically under the sun, if we conceive a straight line drawn from the sun to the top of the pointer of the sundial, the line stretching from the sun to the centre of the earth will be one straight line. If now we conceive another straight line drawn upwards from the extremity of the shadow of the pointer of the sundial in Alexandria, through the top of the pointer to the sun, this straight line and the aforesaid straight line will be parallel, being straight lines drawn through from different parts of the sun to different parts of the earth. Now on these parallel straight lines there falls the straight line drawn from the centre of the earth to the pointer at Alexandria, so that it makes the alternate angles equal; one of these is formed at the centre of the earth by the intersection of the straight lines drawn from the sundials to the centre of the earth; the other is at the intersection of the top of the pointer in Alexandria and the straight line drawn from the extremity of its shadow to the sun through the point where it meets the pointer. Now this latter angle subtends the arc carried round from the extremity of the shadow of the pointer to its base, while the angle at the centre of the earth subtends the arc stretching from Syene to Alexandria. But the arcs are similar since they are subtended by equal angles. Whatever ratio, therefore, the arc in the bowl of the sundial has to its proper circle, the arc reaching from Syene to Alexandria has the same ratio. But the arc in the bowl is found to be the fiftieth part of its proper circle. Therefore the distance from Syene to Alexandria must necessarily be a fiftieth part of the great

GREEK MATHEMATICS

μεγίστου τῆς γῆς κύκλου· καὶ ἔστι τοῦτο σταδίων πεντακισχιλίων. ὁ ἄρα σύμπας κύκλος γίνεται μυριάδων εἴκοσι πέντε. καὶ ἡ μὲν Ἑρατοσθένους ἔφοδος τοιαύτη.

Heron, *Dioptra* 36, ed. H. Schöne 302. 10-17

Δέον δὲ ἔστω, εἰ τύχοι, τὴν μεταξὺ Ἀλεξανδρείας καὶ Ῥώμης ὁδὸν ἐκμετρήσαι τὴν ἐπ' εὐθείας, τὴν γε ἐπὶ κύκλου περιφερείας μεγίστου τοῦ ἐν τῇ γῇ, προσομολογουμένου τοῦ ὅτι περίμετρος τῆς γῆς σταδίων ἐστὶ μ καὶ ἔτι β , ὥς ὁ μάλιστα τῶν ἄλλων ἀκριβέστερον πεπραγματευμένος Ἑρατοσθένης δείκνυσιν ἐν $\langle \tau\omega \rangle$ ¹ ἐπιγραφομένῳ Περὶ τῆς ἀναμετρήσεως τῆς γῆς.

¹ $\tau\omega$ add. H. Schöne.

^a The attached figure will help to elucidate Cleomedes. S is Syene and A Alexandria; the centre of the earth is O. The sun's rays at the two places are represented by the broken straight lines. If α be the angle made by the sun's rays with the pointer of the sundial at Alexandria (OA produced), the angle SOA is also equal to α , or one-fiftieth of four right angles. The arc SA is known to be 5000 stades and it follows that the whole circumference of the earth must be 250000 stades.

ERATOSTHENES

circle of the earth. And this distance is 5000 stades. Therefore the whole great circle is 250000 stades. Such is the method of Eratosthenes.^a

Heron, *Dioptra* 36, ed. H. Schöne 302. 10-17

Let it be required, perchance, to measure the distance between Alexandria and Rome along the arc of a great circle,^b on the assumption that the perimeter of the earth is 252000 stades, as Eratosthenes, who investigated this question more accurately than others, shows in the book which he wrote *On the Measurement of the Earth*.^c

^b Lit. "along the circumference of the greatest circle on the earth."

^c Strabo (ii. 5. 7) and Theon of Smyrna (ed. Hiller 124. 10-12) also give Eratosthenes' measurement as 252000 stades against the 250000 of Cleomedes. "The reason of the discrepancy is not known; it is possible that Eratosthenes corrected 250000 to 252000 for some reason, perhaps in order to get a figure divisible by 60 and, incidentally, a round number (126) of stades for one degree. If Pliny (*N.H.* xii. 13. 58) is right in saying that Eratosthenes made 40 stades equal to the Egyptian *σχοῖνος*, then, taking the *σχοῖνος* at 12000 Royal cubits of 0.525 metres, we get 300 such cubits, or 157.5 metres, *i.e.*, 516.73 feet, as the length of the stade. On this basis 252000 stades works out to 24662 miles, and the diameter of the earth to about 7850 miles, only 50 miles shorter than the true polar diameter, a surprisingly close approximation, however much it owes to happy accidents in the calculation" (Heath, *H.G.M.* ii. 107).

Eutocius, *Commentary on Apollonius's Conics*,
Apoll. Perg. ed. Heiberg ii. 168. 5-170. 26

APOLLONIUS the geometer, my dear Anthemius, flourished at Perga in Pamphylia during the time of Ptolemy Euergetes,^a as is related in the life of Archimedes written by Heraclius,^b who also says that Archimedes first conceived the theorems in conics and that Apollonius, finding they had been discovered by Archimedes but not published, appropriated them for himself, but in my opinion he errs. For in many places Archimedes appears to refer to the elements of conics as an older work, and moreover Apollonius does not claim to be giving his own discoveries; otherwise he would not have described his purpose as "to investigate these properties more fully and more

nomer named Apollonius who flourished in the time of Ptolemy Philopator (221-204 B.C.), the great geometer is probably meant. This fits in with Apollonius's dedication of Books iv.-viii. of his *Conics* to King Attalus I (247-197 B.C.). From the preface to Book i., quoted *infra* (p. 281), we gather that Apollonius visited Eudemus at Pergamum, and to Eudemus he dedicated the first two books of the second edition of his work.

^b More probably Heraclides, *v. supra*, p. 18 n. a.

APOLLONIUS OF PERGA

generally than is done in the works of others.”^a But what Geminus says is correct : defining a cone as the figure formed by the revolution of a right-angled triangle about one of the sides containing the right angle, the ancients naturally took all cones to be right with one section in each—in the right-angled cone the section now called the parabola, in the obtuse-angled the hyperbola, and in the acute-angled the ellipse ; and in this may be found the reason for the names they gave to the sections. Just as the ancients, investigating each species of triangle separately, proved that there were two right angles first in the equilateral triangle, then in the isosceles, and finally in the scalene, whereas the more recent geometers have proved the general theorem, that *in any triangle the three internal angles are equal to two right angles*, so it has been with the sections of the cone ; for the ancients investigated the so-called *section of a right-angled cone* in a right-angled cone only, cutting it by a plane perpendicular to one side of the cone, and they demonstrated the *section of an obtuse-angled cone* in an obtuse-angled cone and the *section of an acute-angled cone* in the acute-angled cone, in the cases of all the cones drawing the planes in the same way perpendicularly to one side of the cone ; hence, it is clear, the ancient names of the curves. But later Apollonius of Perga proved generally that all the sections can be obtained in any cone, whether right or scalene, according to different relations of the plane to the cone. In admiration for this, and on account of the remarkable nature of the theorems in conics proved by him, his contemporaries called him the “Great

* Menaechnus, as shown in vol. i. pp. 278-283, and more particularly p. 283 n. a, solved the problem of the doubling of the cube by means of the intersection of a parabola with a hyperbola, and also by means of the intersection of two parabolas. This is the earliest mention of the conic sections in Greek literature, and therefore Menaechnus (fl. 360-350 B.C.) is generally credited with their discovery; and as Eratosthenes' epigram (vol. i. p. 296) speaks of "cutting the cone in the triads of Menaechnus," he is given credit for discovering the ellipse as well. He may have obtained them all by the method suggested by Geminus, but Heath (*M.G.M.* ii. 111-116) gives cogent reasons for thinking that he may have obtained his rectangular hyperbola by a section of a right-angled cone parallel to the axis.

A passage already quoted (vol. i. pp. 186-189) from Pappus (ed. Hultsch 672. 18-678. 24) informs us that treatises on the conic sections were written by Aristaeus and Euclid. Aristaeus' work, in five books, was entitled *Solid Loci*; Euclid's

Geometer." Geminus relates these details in the sixth book of his *Theory of Mathematics*.^a

(ii.) *Scope of the Work*

Apollonius, *Conics* i., Preface, Apoll. Perg. ed. Heiberg
i. 2. 2-4. 28

Apollonius to Eudemus^b greeting.

If you are in good health and matters are in other respects as you wish, it is well; I am pretty well too. During the time I spent with you at Pergamum, I noticed how eager you were to make acquaintance with my work in conics; I have therefore sent to you the first book, which I have revised, and I will send the remaining books when I am satisfied with them. I suppose you have not forgotten hearing me say that I took up this study at the request of Naucrates the geometer, at the time when he came

Conics was in four books. The work of Aristaëus was obviously more original and more specialized; that of Euclid was admittedly a compilation largely based on Aristaëus. Euclid flourished about 300 B.C. As noted in vol. i. p. 495 n. a, the focus-directrix property must have been known to Euclid, and probably to Aristaëus; curiously, it does not appear in Apollonius's treatise.

Many properties of conics are assumed in the works of Archimedes without proof and several have been encountered in this work; they were no doubt taken from the works of Aristaëus or Euclid. As the reader will notice, Archimedes' terminology differs in several respects from that of Apollonius, apart from the fundamental difference on which Geminus laid stress.

The history of the conic sections in antiquity is admirably treated by Zeuthen, *Die Lehre von den Kegelschnitten im Altertum* (1886) and Heath, *Apollonius of Perga*, xvii-clvi.

^b Not, of course, the pupil of Aristotle who wrote the famous *History of Geometry*, unhappily lost.

παρ' ἡμῖν παραγεννηθεῖς εἰς Ἀλεξάνδρειαν, καὶ διότι πραγματεύσαντες αὐτὰ ἐν ὀκτὼ βιβλίοις ἐξ αὐτῆς μεταδεδώκαμεν αὐτὰ εἰς τὸ σπουδαιότερον διὰ τὸ πρὸς ἐκπλῶ αὐτὸν εἶναι οὐ διακαθάραντες, ἀλλὰ πάντα τὰ ὑποπίπτοντα ἡμῖν θέντες ὡς ἔσχατον ἐπελευσόμενοι. ὅθεν καιρὸν νῦν λαβόντες αἰεὶ τὸ τυγχάνον διορθώσεως ἐκδίδομεν. καὶ ἐπεὶ συμβέβηκε καὶ ἄλλους τινὰς τῶν συμμεμιχότων ἡμῖν μετεिल्φέναι τὸ πρῶτον καὶ τὸ δεύτερον βιβλίον πρὶν ἢ διορθωθῆναι, μὴ θαυμάσης, ἐὰν περιπίπτῃς αὐτοῖς ἐτέρως ἔχουσιν.

Ἀπὸ δὲ τῶν ὀκτὼ βιβλίων τὰ πρῶτα τέσσαρα πέπτωκεν εἰς ἀγωγὴν στοιχειώδη, περιέχει δὲ τὸ μὲν πρῶτον τὰς γενέσεις τῶν τριῶν τομῶν καὶ τῶν ἀντικειμένων καὶ τὰ ἐν αὐταῖς ἀρχικὰ συμπτώματα ἐπὶ πλέον καὶ καθόλου μᾶλλον ἐξεργασμένα παρὰ τὰ ὑπὸ τῶν ἄλλων γεγραμμένα, τὸ δὲ δεύτερον τὰ περὶ τὰς διαμέτρους καὶ τοὺς ἄξονας τῶν τομῶν συμβαίνοντα καὶ τὰς ἀσυμπτῶτους καὶ ἄλλα γενικὴν καὶ ἀναγκαίαν χρεῖαν παρεχόμενα πρὸς τοὺς διορισμούς· τίνας δὲ διαμέτρους καὶ τίνας ἄξονας καλῶ, εἰδήσεις ἐκ τούτου τοῦ βιβλίου. τὸ δὲ τρίτον πολλὰ καὶ παράδοξα θεωρήματα χρήσιμα πρὸς τε τὰς συνθέσεις τῶν στερεῶν τόπων καὶ τοὺς διορισμούς, ὧν τὰ πλεῖστα καὶ κάλλιστα ξένα, ἃ καὶ κατανοήσαντες συνείδομεν μὴ συντιθέμενον ὑπὸ Εὐκλείδου τὸν ἐπὶ τρεῖς καὶ τέσσαρας γραμμὰς τόπον, ἀλλὰ μόριον τὸ τυχὸν αὐτοῦ καὶ τοῦτο οὐκ εὐτυχῶς· οὐ γὰρ ἦν δυνατόν ἄνευ τῶν προσευρημένων ἡμῖν τελειωθῆναι τὴν

^a A necessary observation, because Archimedes had used the terms in a different sense.

APOLLONIUS OF PERGA

to Alexandria and stayed with me, and that, when I had completed the investigation in eight books, I gave them to him at once, a little too hastily, because he was on the point of sailing, and so I was not able to correct them, but put down everything as it occurred to me, intending to make a revision at the end. Accordingly, as opportunity permits, I now publish on each occasion as much of the work as I have been able to correct. As certain other persons whom I have met have happened to get hold of the first and second books before they were corrected, do not be surprised if you come across them in a different form.

Of the eight books the first four form an elementary introduction. The first includes the methods of producing the three sections and the opposite branches [of the hyperbola] and their fundamental properties, which are investigated more fully and more generally than in the works of others. The second book includes the properties of the diameters and the axes of the sections as well as the asymptotes, with other things generally and necessarily used in determining limits of possibility; and what I call diameters and axes you will learn from this book.^a The third book includes many remarkable theorems useful for the syntheses of solid loci and for determining limits of possibility; most of these theorems, and the most elegant, are new, and it was their discovery which made me realize that Euclid had not worked out the synthesis of the locus with respect to three and four lines, but only a chance portion of it, and that not successfully; for the synthesis could not be completed without the theorems discovered by me.^b

^b For this locus, and Pappus's comments on Apollonius's claims, v. vol. i. pp. 486-489.

^a Only the first four books survive in Greek. Books v.-vii. have survived in Arabic, but Book viii. is wholly lost. Halley (Oxford, 1710) edited the first seven books, and his edition is still the only source for Books vi. and vii. The first four books have since been edited by Heiberg (Leipzig, 1891-1893) and Book v. (up to Prop. 7) by L. Nix (Leipzig, 1889). The

APOLLONIUS OF PERGA

The fourth book investigates how many times the sections of cones can meet one another and the circumference of a circle ; in addition it contains other things, none of which have been discussed by previous writers, namely, in how many points a section of a cone or a circumference of a circle can meet [the opposite branches of hyperbolas].

The remaining books are thrown in by way of addition : one of them discusses fully *minima* and *maxima*, another deals with equal and similar sections of cones, another with theorems about the determinations of limits, and the last with determinate conic problems. When they are all published it will be possible for anyone who reads them to form his own judgement. Farewell.^a

(iii.) *Definitions*

Ibid., Definitions, Apoll. Perg. ed. Heiberg i. 6. 2-8. 20

If a straight line be drawn from a point to the circumference of a circle, which is not in the same plane with the point, and be produced in either direction, and if, while the point remains stationary, the straight line be made to move round the circumference of the circle until it returns to the point whence it set out, I call the surface described by the straight line a *conical surface* ; it is composed of two surfaces lying vertically opposite to each other, of which each surviving books have been put into mathematical notation by T. L. Heath, *Apollonius of Perga* (Cambridge, 1896) and translated into French by Paul Ver Eecke, *Les Coniques d'Apollonius de Perga* (Bruges, 1923).

In ancient times Eutocius edited the first four books with a commentary which still survives and is published in Heiberg's edition. Serenus and Hypatia also wrote commentaries, and Pappus a number of lemmas.

γραφούσης εὐθείας εἰς ἄπειρον προσεκβαλλομένης, καλῶ κωνικὴν ἐπιφάνειαν, κορυφὴν δὲ αὐτῆς τὸ μεμενηκὸς σημεῖον, ἄξονα δὲ τὴν διὰ τοῦ σημείου καὶ τοῦ κέντρου τοῦ κύκλου ἀγομένην εὐθεῖαν.

Κῶνον δὲ τὸ περιεχόμενον σχῆμα ὑπὸ τε τοῦ κύκλου καὶ τῆς μεταξὺ τῆς τε κορυφῆς καὶ τῆς τοῦ κύκλου περιφερείας κωνικῆς ἐπιφανείας, κορυφὴν δὲ τοῦ κώνου τὸ σημεῖον, ὃ καὶ τῆς ἐπιφανείας ἐστὶ κορυφή, ἄξονα δὲ τὴν ἀπὸ τῆς κορυφῆς ἐπὶ τὸ κέντρον τοῦ κύκλου ἀγομένην εὐθεῖαν, βάσιν δὲ τὸν κύκλον.

Τῶν δὲ κώνων ὀρθοὺς μὲν καλῶ τοὺς πρὸς ὀρθὰς ἔχοντας ταῖς βάσεσι τοὺς ἄξονας, σκαληνοὺς δὲ τοὺς μὴ πρὸς ὀρθὰς ἔχοντας ταῖς βάσεσι τοὺς ἄξονας.

Πάσης καμπύλης γραμμῆς, ἥτις ἐστὶν ἐν ἐνὶ ἐπιπέδῳ, διάμετρον μὲν καλῶ εὐθεῖαν, ἥτις ἡγμένη ἀπὸ τῆς καμπύλης γραμμῆς πάσας τὰς ἀγομένας ἐν τῇ γραμμῇ εὐθείας εὐθεῖα τινὶ παραλλήλους δίχα διαιρεῖ, κορυφὴν δὲ τῆς γραμμῆς τὸ πέρασ τῆς εὐθείας τὸ πρὸς τῇ γραμμῇ, τεταγμένως δὲ ἐπὶ τὴν διάμετρον κατῆχθαι ἐκάστην τῶν παραλλήλων.

Ὁμοίως δὲ καὶ δύο καμπύλων γραμμῶν ἐν ἐνὶ ἐπιπέδῳ κειμένων διάμετρον καλῶ πλαγίαν μὲν, ἥτις εὐθεῖα τέμνουσα τὰς δύο γραμμὰς πάσας τὰς ἀγομένας ἐν ἐκατέρᾳ τῶν γραμμῶν παρά τινα εὐθεῖαν δίχα τέμνει, κορυφὰς δὲ τῶν γραμμῶν τὰ πρὸς ταῖς γραμμαῖς πέρατα τῆς διαμέτρου, ὀρθίαν δέ, ἥτις κειμένη μεταξὺ τῶν δύο γραμμῶν πάσας τὰς ἀγομένας παραλλήλους εὐθείας εὐθεῖα τινὶ καὶ ἀπολαμβάνομένας μεταξὺ τῶν γραμμῶν δίχα

APOLLONIUS OF PERGA

extends to infinity when the straight line which describes them is produced to infinity ; I call the fixed point the *vertex*, and the straight line drawn through this point and the centre of the circle I call the *axis*.

The figure bounded by the circle and the conical surface between the vertex and the circumference of the circle I term a *cone*, and by the *vertex of the cone* I mean the point which is the vertex of the surface, and by the *axis* I mean the straight line drawn from the vertex to the centre of the circle, and by the *base* I mean the circle.

Of cones, I term those *right* which have their axes at right angles to their bases, and *scalene* those which have their axes not at right angles to their bases.

In any plane curve I mean by a *diameter* a straight line drawn from the curve which bisects all straight lines drawn in the curve parallel to a given straight line, and by the *vertex of the curve* I mean the extremity of the straight line on the curve, and I describe each of the parallels as being drawn *ordinate-wise* to the diameter.

Similarly, in a pair of plane curves I mean by a *transverse diameter* a straight line which cuts the two curves and bisects all the straight lines drawn in either curve parallel to a given straight line, and by the *vertices of the curves* I mean the extremities of the diameter on the curves ; and by an *erect diameter* I mean a straight line which lies between the two curves and bisects the portions cut off between the curves of all straight lines drawn parallel to a given

τέμνει, τεταγμένως δὲ ἐπὶ τὴν διάμετρον κατῆχθαι ἐκάστην τῶν παραλλήλων.

Συζυγεῖς καλῶ διαμέτρους [δύο]¹ καμπύλης γραμμῆς καὶ δύο καμπύλων γραμμῶν εὐθείας, ὧν ἑκάτερα διάμετρος οὔσα τὰς τῇ ἑτέρᾳ παραλλήλους δίχα διαιρεῖ.

Ἄξονα δὲ καλῶ καμπύλης γραμμῆς καὶ δύο καμπύλων γραμμῶν εὐθείαν, ἣτις διάμετρος οὔσα τῆς γραμμῆς ἢ τῶν γραμμῶν πρὸς ὀρθὰς τέμνει τὰς παραλλήλους.

Συζυγεῖς καλῶ ἄξονας καμπύλης γραμμῆς καὶ δύο καμπύλων γραμμῶν εὐθείας, αἵτινες διάμετροι οὔσαι συζυγεῖς πρὸς ὀρθὰς τέμνουσι τὰς ἀλλήλων παραλλήλους.

Prop. 7 ^a

If a cone be cut by a plane through the axis, and if it be also cut by another plane cutting the plane containing the base of the cone in a straight line perpendicular to the base of the axial triangle.^b or to the base produced, a section will be made on the surface of the cone by the cutting plane, and straight lines drawn in it parallel to the straight line perpendicular to the base of the axial triangle will meet the common section of the cutting plane and the axial

later in the work (i. 52-58) that the principal axes are introduced as diameters at right angles to their ordinates. The proposition is an excellent example of the generality of Apollonius's methods.

Apollonius followed rigorously the Euclidean form of proof. In consequence his general enunciations are extremely long and often can be made tolerable in an English rendering only by splitting them up : but, though Apollonius seems to have taken a malicious pleasure in their length, they are formed on a perfect logical pattern without a superfluous word.

^b Lit. "the triangle through the axis."

triangle and, if produced to the other part of the section, will be bisected by it; if the cone be right, the straight line in the base will be perpendicular to the common section of the cutting plane and the axial triangle; but if it be scalene, it will not in general be perpendicular, but only when the plane through the axis is perpendicular to the base of the cone.

Let there be a cone whose vertex is the point A and whose base is the circle BΓ, and let it be cut by a

plane through the axis, and let the section so made be the triangle ABΓ. Now let it be cut by another plane cutting the plane containing the circle BΓ in a straight line ΔE which is either perpendicular to BΓ or to BΓ produced, and let the section made on the surface of the cone be ΔZE^a; then the common section of the cutting plane and of the triangle ABΓ

^a This applies only to the first two of the figures given in the mss.

εἰλήφθω τι σημεῖον ἐπὶ τῆς ΔΖΕ τομῆς τὸ Θ, καὶ ἤχθω διὰ τοῦ Θ τῇ ΔΕ παράλληλος ἡ ΘΚ. λέγω, ὅτι ἡ ΘΚ συμβαλεῖ τῇ ΖΗ καὶ ἐκβαλλομένη ἕως τοῦ ἐτέρου μέρους τῆς ΔΖΕ τομῆς δίχα τμηθήσεται ὑπὸ τῆς ΖΗ εὐθείας.

Ἐπεὶ γὰρ κῶνος, οὗ κορυφή μὲν τὸ Α σημεῖον, βάσις δὲ ὁ ΒΓ κύκλος, τέτμηται ἐπιπέδῳ διὰ τοῦ ἄξονος, καὶ ποιεῖ τομὴν τὸ ΑΒΓ τρίγωνον, εἰληπται δέ τι σημεῖον ἐπὶ τῆς ἐπιφανείας, ὃ μὴ ἔστιν ἐπὶ πλευρᾷ τοῦ ΑΒΓ τριγώνου, τὸ Θ, καὶ ἔστι κάθετος ἡ ΔΗ ἐπὶ τὴν ΒΓ, ἡ ἄρα διὰ τοῦ Θ τῇ ΔΗ παράλληλος ἀγομένη, τουτέστιν ἡ ΘΚ, συμβαλεῖ τῷ ΑΒΓ τριγώνῳ καὶ προσεκβαλλομένη ἕως τοῦ ἐτέρου μέρους τῆς ἐπιφανείας δίχα τμηθήσεται ὑπὸ τοῦ τριγώνου. ἐπεὶ οὖν ἡ διὰ τοῦ Θ τῇ ΔΕ παράλληλος ἀγομένη συμβάλλει τῷ ΑΒΓ τριγώνῳ καὶ ἔστιν ἐν τῷ διὰ τῆς ΔΖΕ τομῆς ἐπιπέδῳ, ἐπὶ τὴν κοινὴν ἄρα τομὴν πεσεῖται τοῦ τέμνοντος ἐπιπέδου καὶ τοῦ ΑΒΓ τριγώνου. κοινὴ δὲ τομὴ ἔστι τῶν ἐπιπέδων ἡ ΖΗ· ἡ ἄρα διὰ τοῦ Θ τῇ ΔΕ παράλληλος ἀγομένη πεσεῖται ἐπὶ τὴν ΖΗ· καὶ προσεκβαλλομένη ἕως τοῦ ἐτέρου μέρους τῆς ΔΖΕ τομῆς δίχα τμηθήσεται ὑπὸ τῆς ΖΗ εὐθείας.

Ἦτοι δὴ ὁ κῶνος ὀρθός ἐστιν, ἢ τὸ διὰ τοῦ ἄξονος τρίγωνον τὸ ΑΒΓ ὀρθὸν ἔστι πρὸς τὸν ΒΓ κύκλον, ἢ οὐδέτερον.

Ἐστω πρότερον ὁ κῶνος ὀρθός· εἴη ἂν οὖν καὶ τὸ ΑΒΓ τρίγωνον ὀρθὸν πρὸς τὸν ΒΓ κύκλον. ἐπεὶ οὖν ἐπίπεδον τὸ ΑΒΓ πρὸς ἐπίπεδον τὸ ΒΓ ὀρθὸν ἔστι, καὶ τῇ κοινῇ αὐτῶν τομῇ τῇ ΒΓ ἐν ἐνὶ τῶν ἐπιπέδων τῷ ΒΓ πρὸς ὀρθὰς ἡκται ἡ ΔΕ,

APOLLONIUS OF PERGA

is ZH . Let any point Θ be taken on ΔZE , and through Θ let ΘK be drawn parallel to ΔE . I say that ΘK intersects ZH and, if produced to the other part of the section ΔZE , it will be bisected by the straight line ZH .

For since the cone, whose vertex is the point A and base the circle $B\Gamma$, is cut by a plane through the axis and the section so made is the triangle $AB\Gamma$, and there has been taken any point Θ on the surface, not being on a side of the triangle $AB\Gamma$, and ΔH is perpendicular to $B\Gamma$, therefore the straight line drawn through Θ parallel to ΔH , that is ΘK , will meet the triangle $AB\Gamma$ and, if produced to the other part of the surface, will be bisected by the triangle [Prop. 6]. Therefore, since the straight line drawn through Θ parallel to ΔE meets the triangle $AB\Gamma$ and is in the plane containing the section ΔZE , it will fall upon the common section of the cutting plane and the triangle $AB\Gamma$. But the common section of those planes is ZH ; therefore the straight line drawn through Θ parallel to ΔE will meet ZH ; and if it be produced to the other part of the section ΔZE it will be bisected by the straight line ZH .

Now the cone is right, or the axial triangle $AB\Gamma$ is perpendicular to the circle $B\Gamma$, or neither.

First, let the cone be right; then the triangle $AB\Gamma$ will be perpendicular to the circle $B\Gamma$ [Def. 3; Eucl. xi. 18]. Then since the plane $AB\Gamma$ is perpendicular to the plane $B\Gamma$, and ΔE is drawn in one of the planes perpendicular to their common section $B\Gamma$, therefore

ἡ ΔΕ ἄρα τῷ ΑΒΓ τριγώνῳ ἐστὶ πρὸς ὀρθάς· καὶ πρὸς πάσας ἄρα τὰς ἀπτομένας αὐτῆς εὐθείας καὶ οὕσας ἐν τῷ ΑΒΓ τριγώνῳ ὀρθή ἐστίν. ὥστε καὶ πρὸς τὴν ΖΗ ἐστὶ πρὸς ὀρθάς.

Μὴ ἔστω δὴ ὁ κῶνος ὀρθός. εἰ μὲν οὖν τὸ διὰ τοῦ ἄξονος τρίγωνον ὀρθόν ἐστὶ πρὸς τὸν ΒΓ κύκλον, ὁμοίως δείξομεν, ὅτι καὶ ἡ ΔΕ τῇ ΖΗ ἐστὶ πρὸς ὀρθάς. μὴ ἔστω δὴ τὸ διὰ τοῦ ἄξονος τρίγωνον τὸ ΑΒΓ ὀρθόν πρὸς τὸν ΒΓ κύκλον. λέγω, ὅτι οὐδὲ ἡ ΔΕ τῇ ΖΗ ἐστὶ πρὸς ὀρθάς. εἰ γὰρ δυνατόν, ἔστω· ἐστὶ δὲ καὶ τῇ ΒΓ πρὸς ὀρθάς· ἡ ἄρα ΔΕ ἐκατέρωθεν τῶν ΒΓ, ΖΗ ἐστὶ πρὸς ὀρθάς. καὶ τῷ διὰ τῶν ΒΓ, ΖΗ ἐπιπέδῳ ἄρα πρὸς ὀρθάς ἐστὶ. τὸ δὲ διὰ τῶν ΒΓ, ΗΖ ἐπιπέδον ἐστὶ τὸ ΑΒΓ· καὶ ἡ ΔΕ ἄρα τῷ ΑΒΓ τριγώνῳ ἐστὶ πρὸς ὀρθάς. καὶ πάντα ἄρα τὰ δι' αὐτῆς ἐπίπεδα τῷ ΑΒΓ τριγώνῳ ἐστὶ πρὸς ὀρθάς. ἐν δέ τι τῶν διὰ τῆς ΔΕ ἐπιπέδων ἐστὶν ὁ ΒΓ κύκλος· ὁ ΒΓ ἄρα κύκλος πρὸς ὀρθάς ἐστὶ τῷ ΑΒΓ τριγώνῳ. ὥστε καὶ τὸ ΑΒΓ τρίγωνον ὀρθόν ἐστὶ πρὸς τὸν ΒΓ κύκλον· ὅπερ οὐχ ὑπόκειται. οὐκ ἄρα ἡ ΔΕ τῇ ΖΗ ἐστὶ πρὸς ὀρθάς.

Πόρισμα

Ἐκ δὴ τούτου φανερόν, ὅτι τῆς ΔΖΕ τομῆς διάμετρος ἐστὶν ἡ ΖΗ, ἐπεὶ περ τὰς ἀγομένας παραλλήλους εὐθείας τινὶ τῇ ΔΕ δίχα τέμνει, καὶ ὅτι δυνατόν ἐστὶν ὑπὸ τῆς διαμέτρου τῆς ΖΗ παραλλήλους τινὰς δίχα τέμνεσθαι καὶ μὴ πρὸς ὀρθάς.

ἡ'

Ἐὰν κῶνος ἐπιπέδῳ τμηθῇ διὰ τοῦ ἄξονος,

APOLLONIUS OF PERGA

ΔE is perpendicular to the triangle $AB\Gamma$ [Eucl. xi. Def. 4]; and therefore it is perpendicular to all the straight lines in the triangle $AB\Gamma$ which meet it [Eucl. xi. Def. 3]. Therefore it is perpendicular to ZH .

Now let the cone be not right. Then, if the axial triangle is perpendicular to the circle $B\Gamma$, we may similarly show that ΔE is perpendicular to ZH . Now let the axial triangle $AB\Gamma$ be not perpendicular to the circle $B\Gamma$. I say that neither is ΔE perpendicular to ZH . For if it is possible, let it be; now it is also perpendicular to $B\Gamma$; therefore ΔE is perpendicular to both $B\Gamma$, ZH . And therefore it is perpendicular to the plane through $B\Gamma$, ZH [Eucl. xi. 4]. But the plane through $B\Gamma$, HZ is $AB\Gamma$; and therefore ΔE is perpendicular to the triangle $AB\Gamma$. Therefore all the planes through it are perpendicular to the triangle $AB\Gamma$ [Eucl. xi. 18]. But one of the planes through ΔE is the circle $B\Gamma$; therefore the circle $B\Gamma$ is perpendicular to the triangle $AB\Gamma$. Therefore the triangle $AB\Gamma$ is perpendicular to the circle $B\Gamma$; which is contrary to hypothesis. Therefore ΔE is not perpendicular to ZH .

Corollary

From this it is clear that ZH is a diameter of the section ΔZE [Def. 4], inasmuch as it bisects the straight lines drawn parallel to the given straight line ΔE , and also that parallels can be bisected by the diameter ZH without being perpendicular to it.

Prop. 8

If a cone be cut by a plane through the axis, and it be

Καὶ φανερόν, ὅτι πάσῃ τῇ δοθείσῃ εὐθείᾳ ἴσην

APOLLONIUS OF PERGA

$AB\Gamma$; now let it be cut by another plane cutting the circle $B\Gamma$ in the straight line ΔE perpendicular to $B\Gamma$, and let the section made on the surface be the curve ΔZE ; let ZH , the diameter of the section ΔZE , be either parallel to $A\Gamma$ or let it, when produced, meet $A\Gamma$ beyond the point A . I say that if the surface of the cone and the cutting plane be produced to infinity, the section ΔZE will also increase to infinity.

For let the surface of the cone and the cutting plane be produced ; it is clear that the straight lines, AB , $A\Gamma$, ZH are simultaneously produced. Since ZH is either parallel to $A\Gamma$ or meets it, when produced, beyond the point A , therefore ZH , $A\Gamma$ when produced in the directions H , Γ , will never meet. Let them be produced accordingly, and let there be taken any point Θ at random upon ZH , and through the point Θ let $K\Theta\Lambda$ be drawn parallel to $B\Gamma$, and let $M\Theta N$ be drawn parallel to ΔE ; the plane through $K\Lambda$, MN is therefore parallel to the plane through $B\Gamma$, ΔE [Eucl. xi. 15]. Therefore the plane $KAMN$ is a circle [Prop. 4]. And since the points Δ , E , M , N are in the cutting plane, and are also on the surface of the cone, they are therefore upon the common section ; therefore ΔZE has increased to M , N . Therefore, when the surface of the cone and the cutting plane increase up to the circle $KAMN$, the section ΔZE increases up to the points M , N . Similarly we may prove that, if the surface of the cone and the cutting plane be produced to infinity, the section $M\Delta ZEN$ will increase to infinity.

And it is clear that there can be cut off from the

GREEK MATHEMATICS

ἀπολήψεται τις ἀπὸ τῆς $Z\Theta$ εὐθείας πρὸς τῷ Z σημείῳ. ἐὰν γὰρ τῇ δοθείσῃ ἴσῃν θῶμεν τὴν $Z\Xi$ καὶ διὰ τοῦ Ξ τῇ ΔE παράλληλον ἀγάγωμεν, συμπεσεῖται τῇ τομῇ, ὥσπερ καὶ ἡ διὰ τοῦ Θ ἀπεδείχθη συμπίπτουσα τῇ τομῇ κατὰ τὰ M, N σημεία· ὥστε ἄγεται τις εὐθεῖα συμπίπτουσα τῇ τομῇ παράλληλος οὖσα τῇ ΔE ἀπολαμβάνουσα ἀπὸ τῆς ZH εὐθείαν ἴσῃν τῇ δοθείσῃ πρὸς τῷ Z σημείῳ.

Ἐὰν κῶνος ἐπιπέδῳ τμηθῇ συμπίπτοντι μὲν ἑκατέρᾳ πλευρᾷ τοῦ διὰ τοῦ ἄξονος τριγώνου, μήτε δὲ παρὰ τὴν βάσιν ἡγμένῳ μήτε ὑπεναντίως, ἡ τομὴ οὐκ ἔσται κύκλος.

Ἐστω κῶνος, οὗ κορυφὴ μὲν τὸ A σημείον,

βάσις δὲ ὁ $B\Gamma$ κύκλος, καὶ τετμήσθω ἐπιπέδῳ τινὶ μήτε παραλλήλῳ ὄντι τῇ βάσει μήτε ὑπ-

APOLLONIUS OF PERGA

straight line $Z\Theta$ in the direction of the point Z an intercept equal to any given straight line. For if we place $Z\Xi$ equal to the given straight line and through Ξ draw a parallel to ΔE , it will meet the section, just as the parallel through Θ was shown to meet the section at the points M, N ; therefore a straight line parallel to ΔE has been drawn to meet the section so as to cut off from ZH in the direction of the point Z an intercept equal to the given straight line.

Prop. 9

If a cone be cut by a plane meeting either side of the axial triangle, but neither parallel to the base nor subcontrary, the section will not be a circle.*

Let there be a cone whose vertex is the point A and base the circle $B\Gamma$, and let it be cut by a plane neither parallel to the base nor subcontrary, and let

* In the figure of this theorem, the section of the cone by the plane ΔE would be a *subcontrary section* (*ὑπεναντία τομῇ*) if the triangle $A\Delta E$ were similar to the triangle $AB\Gamma$, but in a contrary sense, *i.e.*, if $\angle A\Delta E = \angle A\Gamma B$. Apollonius proves in i. 5 that subcontrary sections of the cone are circles; it was proved in i. 4 that all sections parallel to the base are circles.

εναντίως, καὶ ποιεῖτω τομὴν ἐν τῇ ἐπιφανείᾳ τὴν ΔΚΕ γραμμὴν. λέγω, ὅτι ἡ ΔΚΕ γραμμὴ οὐκ ἔσται κύκλος.

Εἰ γὰρ δυνατόν, ἔστω, καὶ συμπιπτέτω τὸ τέμνον ἐπίπεδον τῇ βάσει, καὶ ἔστω τῶν ἐπιπέδων κοινὴ τομὴ ἡ ΖΗ, τὸ δὲ κέντρον τοῦ ΒΓ κύκλου ἔστω τὸ Θ, καὶ ἀπ' αὐτοῦ κάθετος ἤχθω ἐπὶ τὴν ΖΗ ἢ ΘΗ, καὶ ἐκβεβλήσθω διὰ τῆς ΗΘ καὶ τοῦ ἄξονος ἐπίπεδον καὶ ποιεῖτω τομὰς ἐν τῇ κωνικῇ ἐπιφανείᾳ τὰς ΒΑ, ΑΓ εὐθείας. ἐπεὶ οὖν τὰ Δ, Ε, Η σημεία ἐν τε τῷ διὰ τῆς ΔΚΕ ἐπιπέδῳ ἐστίν, ἔστι δὲ καὶ ἐν τῷ διὰ τῶν Α, Β, Γ, τὰ ἄρα Δ, Ε, Η σημεία ἐπὶ τῆς κοινῆς τομῆς τῶν ἐπιπέδων ἐστίν· εὐθεῖα ἄρα ἐστίν ἡ ΗΕΔ. εἰλήφθω δὴ τι ἐπὶ τῆς ΔΚΕ γραμμῆς σημεῖον τὸ Κ, καὶ διὰ τοῦ Κ τῇ ΖΗ παράλληλος ἤχθω ἡ ΚΛ· ἔσται δὴ ἴση ἡ ΚΜ τῇ ΜΛ. ἡ ἄρα ΔΕ διάμετρος ἐστὶ τοῦ ΔΚΛΕ κύκλου. ἤχθω δὴ διὰ τοῦ Μ τῇ ΒΓ παράλληλος ἡ ΝΜΞ· ἔστι δὲ καὶ ἡ ΚΛ τῇ ΖΗ παράλληλος· ὥστε τὸ διὰ τῶν ΝΞ, ΚΜ ἐπίπεδον παράλληλόν ἐστὶ τῷ διὰ τῶν ΒΓ, ΖΗ, τουτέστι τῇ βάσει, καὶ ἔσται ἡ τομὴ κύκλος. ἔστω ὁ ΝΚΞ. καὶ ἐπεὶ ἡ ΖΗ τῇ ΒΗ πρὸς ὀρθὰς ἐστὶ, καὶ ἡ ΚΜ τῇ ΝΞ πρὸς ὀρθὰς ἐστίν· ὥστε τὸ ὑπὸ τῶν ΝΜΞ ἴσον ἐστὶ τῷ ἀπὸ τῆς ΚΜ. ἔστι δὲ τὸ ὑπὸ τῶν ΔΜΕ ἴσον τῷ ἀπὸ τῆς ΚΜ· κύκλος γὰρ ὑπόκειται ἡ ΔΚΕΛ γραμμὴ, καὶ διάμετρος αὐτοῦ ἡ ΔΕ. τὸ ἄρα ὑπὸ τῶν ΝΜΞ ἴσον ἐστὶ τῷ ὑπὸ ΔΜΕ. ἔστιν ἄρα ὡς ἡ ΜΝ πρὸς ΜΔ, οὕτως ἡ ΕΜ πρὸς ΜΞ. ὁμοιον ἄρα ἐστὶ τὸ ΔΜΝ τρίγωνον τῷ ΞΜΕ τριγώνῳ, καὶ ἡ ὑπὸ ΔΝΜ γωνία ἴση ἐστὶ τῇ ὑπὸ ΜΕΞ. ἀλλὰ

APOLLONIUS OF PERGA

the section so made on the surface be the curve ΔKE . I say that the curve ΔKE will not be a circle.

For, if possible, let it be, and let the cutting plane meet the base, and let the common section of the planes be ZH , and let the centre of the circle $B\Gamma$ be Θ , and from it let ΘH be drawn perpendicular to ZH , and let the plane through $H\Theta$ and the axis be produced, and let the sections made on the conical surface be the straight lines $BA, A\Gamma$. Then since the points Δ, E, H are in the plane through ΔKE , and are also in the plane through A, B, Γ , therefore the points Δ, E, H are on the common section of the planes; therefore $HE\Delta$ is a straight line [Eucl. xi. 3]. Now let there be taken any point K on the curve ΔKE , and through K let KA be drawn parallel to ZH ; then KM will be equal to MA [Prop. 7]. Therefore ΔE is a diameter of the circle ΔKEA [Prop. 7, coroll.]. Now let $NM\Xi$ be drawn through M parallel to $B\Gamma$; but KA is parallel to ZH ; therefore the plane through $N\Xi$, KM is parallel to the plane through $B\Gamma$, ZH [Eucl. xi. 15], that is to the base, and the section will be a circle [Prop. 4]. Let it be NKE . And since ZH is perpendicular to BH , KM is also perpendicular to $N\Xi$ [Eucl. xi. 10]; therefore $NM \cdot M\Xi = KM^2$. But $\Delta M \cdot ME = KM^2$; for the curve ΔKEA is by hypothesis a circle, and ΔE is a diameter in it. Therefore $NM \cdot M\Xi = \Delta M \cdot ME$. Therefore $MN : M\Delta = EM : M\Xi$. Therefore the triangle ΔMN is similar to the triangle ΞME , and the angle ΔNM is equal to the angle $N\Xi E$.

APOLLONIUS OF PERGA

But the angle ΔNM is equal to the angle $AB\Gamma$; for $N\Xi$ is parallel to $B\Gamma$; and therefore the angle $AB\Gamma$ is equal to the angle $ME\Xi$. Therefore the section is subcontrary [Prop. 5]; which is contrary to hypothesis. Therefore the curve ΔKE is not a circle.

(v.) *Fundamental Properties*

Ibid., Props. 11-14, Apoll. Perg. ed. Heiberg i. 36. 26-58. 7

Prop. 11

Let a cone be cut by a plane through the axis, and let it be also cut by another plane cutting the base of the cone in a straight line perpendicular to the base of the axial triangle, and further let the diameter of the section be parallel to one side of the axial triangle; then if any straight line be drawn from the section of the cone parallel to the common section of the cutting plane and the base of the cone as far as the diameter of the section, its square will be equal to the rectangle bounded by the intercept made by it on the diameter in the direction of the vertex of the section and a certain other straight line; this straight line will bear the same ratio to the intercept between the angle of the cone and the vertex of the segment as the square on the base of the axial triangle bears to the rectangle bounded by the remaining two sides of the triangle; and let such a section be called a parabola.

For let there be a cone whose vertex is the point A and whose base is the circle $B\Gamma$, and let it be cut by a plane through the axis, and let the section so made be the triangle $AB\Gamma$, and let it be cut by another plane cutting the base of the cone in the straight line

οὔσαν τῇ ΒΓ, καὶ ποιείτω τομὴν ἐν τῇ ἐπιφανείᾳ τοῦ κώνου τὴν ΔΖΕ, ἣ δὲ διάμετρος τῆς τομῆς ἡ ΖΗ παράλληλος ἔστω μιᾷ πλευρᾷ τοῦ διὰ τοῦ ἄξονος τριγώνου τῇ ΑΓ, καὶ ἀπὸ τοῦ Ζ σημείου τῇ ΖΗ εὐθείᾳ πρὸς ὀρθὰς ἤχθω ἡ ΖΘ, καὶ πεποιήσθω, ὥς τὸ ἀπὸ ΒΓ πρὸς τὸ ὑπὸ ΒΑΓ, οὕτως ἡ ΖΘ πρὸς ΖΑ, καὶ εἰλήφθω τι σημεῖον ἐπὶ τῆς τομῆς τυχὸν τὸ Κ, καὶ διὰ τοῦ Κ τῇ ΔΕ παράλληλος ἡ ΚΛ, λέγω, ὅτι τὸ ἀπὸ τῆς ΚΛ ἴσον ἐστὶ τῷ ὑπὸ τῶν ΘΖΛ.

Ἦχθω γὰρ διὰ τοῦ Λ τῇ ΒΓ παράλληλος ἡ ΜΝ· ἔστι δὲ καὶ ἡ ΚΛ τῇ ΔΕ παράλληλος· τὸ ἄρα διὰ τῶν ΚΛ, ΜΝ ἐπίπεδον παράλληλόν ἐστι τῷ διὰ τῶν ΒΓ, ΔΕ ἐπιπέδῳ, τουτέστι τῇ βάσει τοῦ κώνου. τὸ ἄρα διὰ τῶν ΚΛ, ΜΝ ἐπίπεδον κύκλος ἐστίν, οὗ διάμετρος ἡ ΜΝ. καὶ ἔστι κάθετος ἐπὶ τὴν ΜΝ ἡ ΚΛ, ἐπεὶ καὶ ἡ ΔΕ ἐπὶ τὴν ΒΓ· τὸ ἄρα ὑπὸ τῶν ΜΑΝ ἴσον ἐστὶ τῷ ἀπὸ τῆς ΚΛ. καὶ ἐπεὶ ἐστίν, ὥς τὸ ἀπὸ τῆς ΒΓ πρὸς τὸ ὑπὸ τῶν ΒΑΓ, οὕτως ἡ ΘΖ πρὸς ΖΑ, τὸ δὲ

APOLLONIUS OF PERGA

ΔE perpendicular to $B\Gamma$, and let the section so made on the surface of the cone be ΔZE , and let ZH , the diameter of the section, be parallel to $A\Gamma$, one side of the axial triangle, and from the point Z let $Z\Theta$ be drawn perpendicular to ZH , and let $B\Gamma^2 : BA \cdot A\Gamma = Z\Theta : ZA$, and let any point K be taken at random on the section, and through K let $K\Lambda$ be drawn parallel to ΔE . I say that $K\Lambda^2 = \Theta Z \cdot Z\Lambda$.

For let MN be drawn through Λ parallel to $B\Gamma$; but $K\Lambda$ is parallel to ΔE ; therefore the plane through

$K\Lambda$, MN is parallel to the plane through $B\Gamma$, ΔE [Eucl. xi. 15], that is to the base of the cone. Therefore the plane through $K\Lambda$, MN is a circle, whose diameter is MN [Prop. 4]. And $K\Lambda$ is perpendicular to MN , since ΔE is perpendicular to $B\Gamma$ [Eucl. xi. 10]; therefore $MA \cdot \Lambda N = K\Lambda^2$.

And since $B\Gamma^2 : BA \cdot A\Gamma = \Theta Z : ZA$,

ἀπὸ τῆς ΒΓ πρὸς τὸ ὑπὸ τῶν ΒΑΓ λόγον ἔχει τὸν συγκείμενον ἐκ τε τοῦ, ὃν ἔχει ἡ ΒΓ πρὸς ΓΑ καὶ ἡ ΒΓ πρὸς ΒΑ, ὁ ἄρα τῆς ΘΖ πρὸς ΖΑ λόγος σύγκειται ἐκ τοῦ τῆς ΒΓ πρὸς ΓΑ καὶ τοῦ τῆς ΓΒ πρὸς ΒΑ. ἀλλ' ὡς μὲν ἡ ΒΓ πρὸς ΓΑ, οὕτως ἡ ΜΝ πρὸς ΝΑ, τουτέστιν ἡ ΜΛ πρὸς ΛΖ, ὡς δὲ ἡ ΒΓ πρὸς ΒΑ, οὕτως ἡ ΜΝ πρὸς ΜΑ, τουτέστιν ἡ ΛΜ πρὸς ΜΖ, καὶ λοιπὴ ἡ ΝΛ πρὸς ΖΑ. ὁ ἄρα τῆς ΘΖ πρὸς ΖΑ λόγος σύγκειται ἐκ τοῦ τῆς ΜΛ πρὸς ΛΖ καὶ τοῦ τῆς ΝΛ πρὸς ΖΑ. ὁ δὲ συγκείμενος λόγος ἐκ τοῦ τῆς ΜΛ πρὸς ΛΖ καὶ τοῦ τῆς ΛΝ πρὸς ΖΑ ὁ τοῦ ὑπὸ ΜΑΝ ἐστὶ πρὸς τὸ ὑπὸ ΛΖΑ. ὡς ἄρα ἡ ΘΖ πρὸς ΖΑ, οὕτως τὸ ὑπὸ ΜΑΝ πρὸς τὸ ὑπὸ ΛΖΑ. ὡς δὲ ἡ ΘΖ πρὸς ΖΑ, τῆς ΖΛ κοινού ὕψους λαμβανομένης οὕτως τὸ ὑπὸ ΘΖΛ πρὸς τὸ ὑπὸ ΛΖΑ. ὡς ἄρα τὸ ὑπὸ ΜΑΝ πρὸς τὸ ὑπὸ ΛΖΑ, οὕτως τὸ ὑπὸ ΘΖΛ πρὸς τὸ ὑπὸ ΛΖΑ. ἴσον ἄρα ἐστὶ τὸ ὑπὸ ΜΑΝ τῷ ὑπὸ ΘΖΛ. τὸ δὲ ὑπὸ ΜΑΝ ἴσον ἐστὶ τῷ ἀπὸ τῆς ΚΛ. καὶ τὸ ἀπὸ τῆς ΚΛ ἄρα ἴσον ἐστὶ τῷ ὑπὸ τῶν ΘΖΛ.

Καλείσθω δὲ ἡ μὲν τοιαύτη τομὴ παραβολή, ἡ δὲ ΘΖ παρ' ἣν δύνανται αἱ καταγόμεναι τεταγμένως ἐπὶ τὴν ΖΗ διάμετρον, καλείσθω δὲ καὶ ὀρθία.

Ἐὰν κῶνος ἐπιπέδῳ τμηθῇ διὰ τοῦ ἄξονος, τμηθῇ δὲ καὶ ἐτέρῳ ἐπιπέδῳ τέμνοντι τὴν βάσιν

^a A parabola (παραβολή) because the square on the ordinate ΚΛ is applied (παροβαλεῖν) to the parameter ΘΖ in the form

APOLLONIUS OF PERGA

while $BF^2 : BA \cdot A\Gamma = (BF : \Gamma A)(BF : BA)$,
 therefore $\Theta Z : ZA = (BF : \Gamma A)(\Gamma B : BA)$.
 But $BF : \Gamma A = MN : NA$
 $= MA : \Lambda Z$, [Eucl. vi. 4
 and $BF : BA = MN : MA$
 $= \Lambda M : MZ$ [*ibid.*
 $= NA : ZA$. [Eucl. vi. 2
 Therefore $\Theta Z : ZA = (MA : \Lambda Z)(NA : ZA)$.
 But $(MA : \Lambda Z)(\Lambda N : ZA) = MA \cdot \Lambda N : \Lambda Z \cdot ZA$.
 Therefore $\Theta Z : ZA = MA \cdot \Lambda N : \Lambda Z \cdot ZA$.
 But $\Theta Z : ZA = \Theta Z \cdot ZA : \Lambda Z \cdot ZA$,
 by taking a common height ZA ;
 therefore $MA \cdot \Lambda N : \Lambda Z \cdot ZA = \Theta Z \cdot ZA : \Lambda Z \cdot ZA$.
 Therefore $MA \cdot \Lambda N = \Theta Z \cdot ZA$. [Eucl. v. 9
 But $MA \cdot \Lambda N = K\Lambda^2$;
 and therefore $K\Lambda^2 = \Theta Z \cdot ZA$.

Let such a section be called a *parabola*, and let ΘZ be called the *parameter of the ordinates* to the diameter ZH , and let it also be called the *erect side* (*latus rectum*).^a

Prop. 12

Let a cone be cut by a plane through the axis, and let it be cut by another plane cutting the base of the cone in of the rectangle $\Theta Z \cdot ZA$, and is exactly equal to this rectangle. It was Apollonius's most distinctive achievement to have based his treatment of the conic sections on the Pythagorean theory of the *application of areas* (*παραβολή τῶν χωρίων*), for which v. vol. i. pp. 186-215. The explanation of the term *latus rectum* will become more obvious in the cases of the hyperbola and the ellipse; v. *infra*, p. 317 n. a.

τοῦ κώνου κατ' εὐθείαν πρὸς ὀρθὰς οὖσαν τῇ βάσει τοῦ διὰ τοῦ ἄξονος τριγώνου, καὶ ἡ διάμετρος τῆς τομῆς ἐκβαλλομένη συμπίπτῃ μιᾷ πλευρᾷ τοῦ διὰ τοῦ ἄξονος τριγώνου ἐκτὸς τῆς τοῦ κώνου κορυφῆς, ἥτις ἂν ἀπὸ τῆς τομῆς ἀχθῇ παράλληλος τῇ κοινῇ τομῇ τοῦ τέμνοντος ἐπιπέδου καὶ τῆς βάσεως τοῦ κώνου, ἕως τῆς διαμέτρου τῆς τομῆς δυνήσεται τι χωρίον παρακείμενον παρά τινα εὐθείαν, πρὸς ἣν λόγον ἔχει ἡ ἐπ' εὐθείας μὲν οὖσα τῇ διαμέτρῳ τῆς τομῆς, ὑποτείνουσα δὲ τὴν ἐκτὸς τοῦ τριγώνου γωνίαν, ὃν τὸ τετράγωνον τὸ ἀπὸ τῆς ἡγμένης ἀπὸ τῆς κορυφῆς τοῦ κώνου παρά τὴν διάμετρον τῆς τομῆς ἕως τῆς βάσεως τοῦ τριγώνου πρὸς τὸ περιεχόμενον ὑπὸ τῶν τῆς βάσεως τμημάτων, ὧν ποιεῖ ἡ ἀχθείσα, πλάτος ἔχον τὴν ἀπολαμβανομένην ὑπ' αὐτῆς ἀπὸ τῆς διαμέτρου πρὸς τῇ κορυφῇ τῆς τομῆς, ὑπερβάλλον εἶδει ὁμοίῳ τε καὶ ὁμοίως κειμένῳ τῷ περιεχομένῳ ὑπὸ τε τῆς ὑποτεينوῦσης τὴν ἐκτὸς γωνίαν τοῦ τριγώνου καὶ τῆς παρ' ἣν δύνανται αἱ καταγόμεναι· καλείσθω δὲ ἡ τοιαύτη τομὴ ὑπερβολή.

APOLLONIUS OF PERGA

MN, PΣ is parallel to the plane through BΓ, ΔΕ [Eucl. xi. 15], that is to the base of the cone. If, then, the plane through MN, PΣ be produced, the section will be a circle with diameter PNΣ [Prop. 4]. And MN is perpendicular to it; therefore

$$PN \cdot NΣ = MN^2.$$

And since $AK^2 : BK \cdot KΓ = ZΘ : ZΛ$,

while $AK^2 : BK \cdot KΓ = (AK : KΓ)(AK : KB)$,

therefore $ZΘ : ZΛ = (AK : KΓ)(AK : KB)$.

But $AK : KΓ = ΘH : HΓ$,

i.e., $ΘH : HΓ = ΘN : NΣ$, [Eucl. vi. 4]

and $AK : KB = ZH : HB$,

i.e., $ZH : HB = ZN : NP$. [*ibid.*]

Therefore $ΘZ : ZΛ = (ΘN : NΣ)(ZN : NP)$.

But $(ΘN : NΣ)(ZN : NP) = ΘN \cdot NZ : ΣN \cdot NP$;

and therefore

$$\begin{aligned} \Theta N \cdot NZ : \Sigma N \cdot NP &= \Theta Z : Z\Lambda \\ &= \Theta N : N\Xi. \end{aligned} \quad [\textit{ibid.}]$$

But $\Theta N : N\Xi = \Theta N \cdot NZ : ZN \cdot N\Xi$,

by taking a common height ZN.

And therefore

$$\Theta N \cdot NZ : \Sigma N \cdot NP = \Theta N \cdot NZ : \Xi N \cdot NZ.$$

Therefore $\Sigma N \cdot NP = \Xi N \cdot NZ$. [Eucl. v. 9]

But $MN^2 = \Sigma N \cdot NP$,

as was proved;

and therefore $MN^2 = \Xi N \cdot NZ$.

But the rectangle $\Xi N \cdot NZ$ is the parallelogram ΞZ .

GREEK MATHEMATICS

ΜΝ δύναται τὸ ΕΖ, ὃ παράκειται παρὰ τὴν ΖΛ, πλάτος ἔχον τὴν ΖΝ, ὑπερβάλλον τῷ ΛΞ ὁμοίῳ ὄντι τῷ ὑπὸ τῶν ΘΖΛ. καλείσθω δὲ ἡ μὲν τοιαύτη τομὴ ὑπερβολή, ἡ δὲ ΛΖ παρ' ἣν δύνανται αἱ ἐπὶ τὴν ΖΗ καταγόμεναι τεταγμένως· καλείσθω δὲ ἡ αὐτὴ καὶ ὀρθία, πλαγία δὲ ἡ ΖΘ.

APOLLONIUS OF PERGA

and whose base is the circle BT , and let it be cut by a plane through the axis, and let the section so made be the triangle ABT , and let it be cut by another plane meeting either side of the axial triangle, being drawn neither parallel to the base nor subcontrary, and let the section made on the surface of the cone be the curve ΔE ; let the common section of the cutting plane and of that containing the base of the cone be ZH , perpendicular to BT , and let the diameter of the section be $E\Delta$, and from E let $E\Theta$ be drawn perpendicular to $E\Delta$, and through A let AK be drawn parallel to $E\Delta$, and let $AK^2 : BK \cdot K\Gamma = \Delta E : E\Theta$, and let any point Λ be taken on the section, and through Λ let ΛM be drawn parallel to ZH . I say that the square on ΛM is equal to an area applied to the straight line $E\Theta$, having EM for its breadth, and being deficient by a figure similar to the rectangle contained by ΔE , $E\Theta$.

For let $\Delta\Theta$ be joined, and through M let $M\Xi N$ be

ΘΕ παράλληλος ἤχθω ἡ ΜΕΝ, διὰ δὲ τῶν Θ, Ξ τῇ ΕΜ παράλληλοι ἤχθωσαν αἱ ΘΝ, ΞΟ, καὶ διὰ τοῦ Μ τῇ ΒΓ παράλληλος ἤχθω ἡ ΠΜΡ. ἐπεὶ οὖν ἡ ΠΡ τῇ ΒΓ παράλληλός ἐστιν, ἔστι δὲ καὶ ἡ ΛΜ τῇ ΖΗ παράλληλος, τὸ ἄρα διὰ τῶν ΛΜ, ΠΡ ἐπίπεδον παράλληλόν ἐστι τῷ διὰ τῶν ΖΗ, ΒΓ ἐπιπέδῳ, τουτέστι τῇ βάσει τοῦ κώνου. ἐὰν ἄρα ἐκβληθῇ διὰ τῶν ΛΜ, ΠΡ ἐπίπεδον, ἡ τομὴ κύκλος ἔσται, οὗ διάμετρος ἡ ΠΡ. καὶ ἐστὶ κάθετος ἐπ' αὐτὴν ἡ ΛΜ· τὸ ἄρα ὑπὸ τῶν ΠΜΡ ἴσον ἐστὶ τῷ ἀπὸ τῆς ΛΜ. καὶ ἐπεὶ ἐστίν, ὡς τὸ ἀπὸ τῆς ΑΚ πρὸς τὸ ὑπὸ τῶν ΒΚΓ, οὕτως ἡ ΕΔ πρὸς τὴν ΕΘ, ὁ δὲ τοῦ ἀπὸ τῆς ΑΚ πρὸς τὸ ὑπὸ τῶν ΒΚΓ λόγος σύγκειται ἐκ τοῦ, ὃν ἔχει ἡ ΑΚ πρὸς ΚΒ, καὶ ἡ ΑΚ πρὸς ΚΓ, ἀλλ' ὡς μὲν ἡ ΑΚ πρὸς ΚΒ, οὕτως ἡ ΕΗ πρὸς ΗΒ, τουτέστιν ἡ ΕΜ πρὸς ΜΠ, ὡς δὲ ἡ ΑΚ πρὸς ΚΓ, οὕτως ἡ ΔΗ πρὸς ΗΓ, τουτέστιν ἡ ΔΜ πρὸς ΜΡ, ὁ ἄρα τῆς ΔΕ πρὸς τὴν ΕΘ λόγος σύγκειται ἐκ τε τοῦ τῆς ΕΜ πρὸς ΜΠ καὶ τοῦ τῆς ΔΜ πρὸς ΜΡ. ὁ δὲ συγκείμενος λόγος ἐκ τε τοῦ, ὃν ἔχει ἡ ΕΜ πρὸς ΜΠ, καὶ ἡ ΔΜ πρὸς ΜΡ, ὁ τοῦ ὑπὸ τῶν ΕΜΔ ἐστὶ πρὸς τὸ ὑπὸ τῶν ΠΜΡ. ἔστιν ἄρα ὡς τὸ ὑπὸ τῶν ΕΜΔ πρὸς τὸ ὑπὸ τῶν ΠΜΡ, οὕτως ἡ ΔΕ πρὸς τὴν ΕΘ, τουτέστιν ἡ ΔΜ πρὸς τὴν ΜΞ. ὡς δὲ ἡ ΔΜ πρὸς ΜΞ, τῆς ΜΕ κοινού ὕψους λαμβανομένης, οὕτως τὸ ὑπὸ ΔΜΕ πρὸς τὸ ὑπὸ ΕΜΕ. καὶ ὡς ἄρα τὸ ὑπὸ ΔΜΕ πρὸς τὸ ὑπὸ ΠΜΡ, οὕτως τὸ ὑπὸ ΔΜΕ πρὸς τὸ ὑπὸ ΕΜΕ. ἴσον ἄρα ἐστὶ τὸ ὑπὸ ΠΜΡ τῷ ὑπὸ ΕΜΕ. τὸ δὲ ὑπὸ ΠΜΡ ἴσον ἐδείχθη τῷ ἀπὸ τῆς ΛΜ· καὶ τὸ ὑπὸ ΕΜΕ ἄρα ἐστὶν ἴσον τῷ ἀπὸ τῆς ΛΜ. ἡ ΛΜ

APOLLONIUS OF PERGA

drawn parallel to θE , and through θ , Ξ , let θN , ΞO be drawn parallel to EM , and through M let ΠMP be drawn parallel to $B\Gamma$. Then since ΠP is parallel to $B\Gamma$, and ΔM is parallel to ZH , therefore the plane through ΔM , ΠP is parallel to the plane through ZH , $B\Gamma$ [Eucl. xi. 15], that is to the base of the cone. If, therefore, the plane through ΔM , ΠP be produced, the section will be a circle with diameter ΠP [Prop. 4]. And ΔM is perpendicular to it ; therefore

$$\Pi M \cdot MP = \Delta M^2.$$

And since $AK^2 : BK \cdot K\Gamma = E\Delta : E\theta$,

and $AK^2 : BK \cdot K\Gamma = (AK : KB)(AK : K\Gamma)$,

while $AK : KB = EH : HB$

$$= EM : \Pi H, \text{ [Eucl. vi. 4]}$$

and $AK : K\Gamma = \Delta H : H\Gamma$

$$= \Delta M : MP, \text{ [ibid.]}$$

therefore $\Delta E : E\theta = (EM : \Pi H)(\Delta M : MP)$.

But $(EM : \Pi H)(\Delta M : MP) = EM \cdot M\Delta : \Pi M \cdot MP$.

Therefore

$$EM \cdot M\Delta : \Pi M \cdot MP = \Delta E : E\theta$$

$$= \Delta M : M\Xi. \text{ [ibid.]}$$

But $\Delta M : M\Xi = \Delta M \cdot ME : \Xi M \cdot ME$,

by taking a common height ME .

Therefore $\Delta M \cdot ME : \Pi M \cdot MP = \Delta M \cdot ME : \Xi M \cdot ME$.

Therefore $\Pi M \cdot MP = \Xi M \cdot ME$. [Eucl. v. 9]

But $\Pi M \cdot MP = \Delta M^2$,

as was proved ;

and therefore $\Xi M \cdot ME = \Delta M^2$.

ἄρα δύναται τὸ MO , ὃ παράκειται παρὰ τὴν ΘE , πλάτος ἔχον τὴν EM , ἑλλείπον εἶδει τῷ ON ὁμοίω ὄντι τῷ ὑπὸ $\Delta E\Theta$. καλείσθω δὲ ἡ μὲν τοιαύτη τομὴ ἑλλειψις, ἡ δὲ $E\Theta$ παρ' ἣν δύνανται αἱ καταγόμεναι ἐπὶ τὴν ΔE τεταγμένως, ἡ δὲ αὐτὴ καὶ ὀρθία, πλαγία δὲ ἡ $E\Delta$.

ιδ'

Ἐὰν αἱ κατὰ κορυφὴν ἐπιφάνειαι ἐπιπέδῳ τμηθῶσι μὴ διὰ τῆς κορυφῆς, ἔσται ἐν ἑκατέρᾳ τῶν ἐπιφανειῶν τομὴ ἡ καλουμένη ὑπερβολή, καὶ τῶν δύο τομῶν ἡ τε διάμετρος ἡ αὐτὴ ἔσται, καὶ παρ' αὗς δύνανται αἱ ἐπὶ τὴν διάμετρον καταγόμεναι παράλληλοι τῇ ἐν τῇ βάσει τοῦ κώνου εὐθείᾳ ἴσαι, καὶ τοῦ εἶδους ἡ πλαγία πλευρὰ κοινὴ ἡ μεταξὺ τῶν κορυφῶν τῶν τομῶν· καλείσθωσαν δὲ αἱ τοιαῦται τομαὶ ἀντικείμεναι.

Ἐστῶσαν αἱ κατὰ κορυφὴν ἐπιφάνειαι, ὧν κορυφὴ τὸ A σημεῖον, καὶ τετμήσθωσαν ἐπιπέδῳ μὴ διὰ τῆς κορυφῆς, καὶ ποιείτω ἐν τῇ ἐπιφανείᾳ τομὰς τὰς ΔEZ , $H\Theta K$. λέγω, ὅτι ἑκατέρᾳ τῶν ΔEZ , $H\Theta K$ τομῶν ἔστιν ἡ καλουμένη ὑπερβολή.

^a Let p be the parameter of a conic section and d the corresponding diameter, and let the diameter of the section and the tangent at its extremity be taken as axes of co-ordinates (in general oblique). Then Props. 11-13 are equivalent to the Cartesian equations.

APOLLONIUS OF PERGA

Therefore the square on AM is equal to MO , which is applied to ΘE , having EM for its breadth, and being deficient by the figure ON similar to the rectangle $\Delta E \cdot E\Theta$. Let such a section be called an *eclipse*, let $E\Theta$ be called *the parameter to the ordinates to ΔE* , and let this line be called the *erect side* (*latus rectum*), and $E\Delta$ the *transverse side*.^a

Prop. 14

If the vertically opposite surfaces [of a double cone] be cut by a plane not through the vertex, there will be formed on each of the surfaces the section called a hyperbola, and the diameter of both sections will be the same, and the parameter to the ordinates drawn parallel to the straight line in the base of the cone will be equal, and the transverse side of the figure will be common, being the straight line between the vertices of the sections; and let such sections be called opposite.

Let there be vertically opposite surfaces having the point A for vertex, and let them be cut by a plane not through the vertex, and let the sections so made on the surface be ΔEZ , $H\Theta K$. I say that each of the sections ΔEZ , $H\Theta K$ is the so-called hyperbola.

$y^2 = px$ (the parabola),
and

$y^2 = px \pm \frac{p}{a^2} x^2$ (the hyperbola and ellipse respectively).

It is the essence of Apollonius's treatment to express the fundamental properties of the conics as equations between *areas*, whereas Archimedes had given the fundamental properties of the central conics as *proportions*

$$y^2 : (a^2 \mp wy^2) = a^2 : b^2.$$

This form is, however, equivalent to the Cartesian equations referred to axes through the centre.

GREEK MATHEMATICS

Ἐστω γὰρ ὁ κύκλος, καθ' οὗ φέρεται ἡ τὴν ἐπιφανείαν γράφουσα εὐθεΐα, ὁ ΒΔΓΖ, καὶ ἤχθω

ἐν τῇ κατὰ κορυφήν ἐπιφανείᾳ παράλληλον αὐτῷ ἐπίπεδον τὸ ΕΗΟΚ· κοινὰ δὲ τομαὶ τῶν ΗΘΚ, ΖΕΔ τομῶν καὶ τῶν κύκλων αἱ ΖΔ, ΗΚ· ἔσονται δὴ παράλληλοι. ἄξων δὲ ἔστω τῆς κωνικῆς ἐπιφανείας ἡ ΛΑΥ εὐθεΐα, κέντρα δὲ τῶν κύκλων τὰ Λ, Υ, καὶ ἀπὸ τοῦ Λ ἐπὶ τὴν ΖΔ κάθετος ἀχθείσα ἐκβεβλήσθω ἐπὶ τὰ Β, Γ σημεῖα, καὶ διὰ τῆς ΒΓ καὶ τοῦ ἄξονος ἐπίπεδον ἐκβεβλήσθω· ποιήσει δὴ τομὰς ἐν μὲν τοῖς κύκλοις παραλλήλους εὐθείας τὰς ΕΟ, ΒΓ, ἐν δὲ τῇ ἐπιφανείᾳ τὰς ΒΑΟ, ΓΑΕ.

APOLLONIUS OF PERGA

For let $B\Delta\Gamma Z$ be the circle round which revolves the straight line describing the surface, and in the vertically opposite surface let there be drawn parallel to it a plane ΞHOK ; the common sections of the sections HOK , $ZE\Delta$ and of the circles [Prop. 4] will be $Z\Delta$, HK ; and they will be parallel [Eucl. xi. 16]. Let the axis of the conical surface be ΛAY , let the centres of the circles be Λ , Y , and from Λ let a perpendicular be drawn to $Z\Delta$ and produced to the points B , Γ , and let the plane through $B\Gamma$ and the axis be produced; it will make in the circles the parallel straight lines ΞO , $B\Gamma$, and on the surface BAO , $\Gamma A\Xi$;

ἔσται δὴ καὶ ἡ $\Xi\Theta$ τῇ $\Pi\kappa$ πρὸς ὀρθάς, ἐπειδὴ καὶ ἡ ΒΓ τῇ ΖΔ ἐστὶ πρὸς ὀρθάς, καὶ ἐστὶν ἑκατέρα παράλληλος. καὶ ἐπεὶ τὸ διὰ τοῦ ἄξονος ἐπίπεδον ταῖς τομαῖς συμβάλλει κατὰ τὰ Μ , Ν σημεία ἐντὸς τῶν γραμμῶν, δῆλον, ὡς καὶ τὰς γραμμὰς τέμνει τὸ ἐπίπεδον. τεμνέτω κατὰ τὰ Θ , Ε τὰ ἄρα Μ , Ε , Θ , Ν σημεία ἔν τε τῷ διὰ τοῦ ἄξονός ἐστιν ἐπιπέδῳ καὶ ἐν τῷ ἐπιπέδῳ, ἐν ᾧ εἰσιν αἱ γραμμαὶ εὐθεῖα ἄρα ἐστὶν ἡ ΜΕΘΝ γραμμὴ. καὶ φανερόν, ὅτι τὰ τε Ξ , Θ , Α , Γ ἐπ' εὐθείας ἐστὶ καὶ τὰ Β , Ε , Α , Ο . ἔν τε γὰρ τῇ κωνικῇ ἐπιφανείᾳ ἐστὶ καὶ ἐν τῷ διὰ τοῦ ἄξονος ἐπιπέδῳ. ἤχθωσαν δὴ ἀπὸ μὲν τῶν Θ , Ε τῇ $\Theta\text{Ε}$ πρὸς ὀρθὰς αἱ $\Theta\text{Ρ}$, ΕΠ , διὰ δὲ τοῦ Α τῇ ΜΕΘΝ παράλληλος ἤχθω ἡ $\Sigma\text{ΑΤ}$, καὶ πεποιήσθω, ὡς μὲν τὸ ἀπὸ τῆς ΑΣ πρὸς τὸ ὑπὸ ΒΣΓ , οὕτως ἡ $\Theta\text{Ε}$ πρὸς ΕΠ , ὡς δὲ τὸ ἀπὸ τῆς ΑΤ πρὸς τὸ ὑπὸ ΟΤΞ , οὕτως ἡ ΕΘ πρὸς $\Theta\text{Ρ}$. ἐπεὶ οὖν κώνος, οὗ κορυφὴ μὲν τὸ Α σημείον, βάσις δὲ ὁ ΒΓ κύκλος, τέτμηται ἐπιπέδῳ διὰ τοῦ ἄξονος, καὶ πεποιήκε τομὴν τὸ ΑΒΓ τρίγωνον, τέτμηται δὲ καὶ ἐτέρῳ ἐπιπέδῳ τέμνοντι τὴν βάσιν τοῦ κώνου κατ' εὐθεῖαν τὴν $\Delta\text{ΜΖ}$ πρὸς ὀρθὰς οὖσαν τῇ ΒΓ , καὶ πεποιήκε τομὴν ἐν τῇ ἐπιφανείᾳ τὴν $\Delta\text{ΕΖ}$, ἡ δὲ διάμετρος ἡ ΜΕ ἐκβαλλομένη συμπίπτωκε μιᾷ πλευρᾷ τοῦ διὰ τοῦ ἄξονος τριγώνου ἐκτὸς τῆς κορυφῆς τοῦ κώνου, καὶ διὰ τοῦ Α σημείου τῇ διαμέτρῳ τῆς τομῆς τῇ ΕΜ παράλληλος ἥκται ἡ ΑΣ , καὶ ἀπὸ τοῦ Ε τῇ ΕΜ πρὸς ὀρθὰς ἥκται ἡ ΕΠ , καὶ ἐστὶν ὡς τὸ ἀπὸ ΑΣ πρὸς τὸ ὑπὸ ΒΣΓ , οὕτως ἡ ΕΘ πρὸς ΕΠ , ἡ μὲν $\Delta\text{ΕΖ}$ ἄρα τομὴ ὑπερβολὴ ἐστὶν, ἡ δὲ ΕΠ παρ' ἣν δύνανται αἱ ἐπὶ τὴν ΕΜ καταγόμεναι τεταγμένως, πλαγία

APOLLONIUS OF PERGA

now ΞO will be perpendicular to HK , since $B\Gamma$ is perpendicular to $Z\Delta$, and each is parallel [Eucl. xi. 10]. And since the plane through the axis meets the sections at the points M, N within the curves, it is clear that the plane cuts the curves. Let it cut them at the points Θ, E ; then the points M, E, Θ, N are both in the plane through the axis and in the plane containing the curves; therefore the line $ME\Theta N$ is a straight line [Eucl. xi. 3]. And it is clear that Ξ, Θ, A, Γ are on a straight line, and also B, E, A, O ; for they are both on the conical surface and in the plane through the axis. Now let $\Theta P, E\Pi$ be drawn from Θ, E perpendicular to ΘE , and through A let ΣAT be drawn parallel to $ME\Theta N$, and let

$$A\Sigma^2 : B\Sigma \cdot \Sigma\Gamma = \Theta E : E\Pi,$$

and

$$AT^2 : OT \cdot T\Xi = E\Theta : \Theta P.$$

Then since the cone, whose vertex is the point A and whose base is the circle $B\Gamma$, is cut by a plane through the axis, and the section so made is the triangle $AB\Gamma$, and it is cut by another plane cutting the base of the cone in the straight line ΔMZ perpendicular to $B\Gamma$, and the section so made on the surface is ΔEZ , and the diameter ME produced meets one side of the axial triangle beyond the vertex of the cone, and $A\Sigma$ is drawn through the point A parallel to the diameter of the section EM , and $E\Pi$ is drawn from E perpendicular to EM , and $A\Sigma^2 : B\Sigma \cdot \Sigma\Gamma = E\Theta : E\Pi$, therefore the section ΔEZ is a hyperbola, in which $E\Pi$ is the parameter to the ordinates to EM , and ΘE is the

δὲ τοῦ εἵδους πλευρὰ ἡ ΘΕ. ὁμοίως δὲ καὶ ἡ ΗΘΚ ὑπερβολὴ ἐστίν, ἥς διάμετρος μὲν ἡ ΘΝ, ἡ δὲ ΘΡ παρ' ἣν δύνανται αἱ ἐπὶ τὴν ΘΝ καταγόμεναι τεταγμένως, πλαγία δὲ τοῦ εἵδους πλευρὰ ἡ ΘΕ.

Λέγω, ὅτι ἴση ἐστὶν ἡ ΘΡ τῇ ΕΠ. ἐπεὶ γὰρ παράλληλός ἐστίν ἡ ΒΓ τῇ ΕΟ, ἔστιν ὡς ἡ ΑΣ πρὸς ΣΓ, οὕτως ἡ ΑΤ πρὸς ΤΕ, καὶ ὡς ἡ ΑΣ πρὸς ΣΒ, οὕτως ἡ ΑΤ πρὸς ΤΟ. ἀλλ' ὁ τῆς ΑΣ πρὸς ΣΓ λόγος μετὰ τοῦ τῆς ΑΣ πρὸς ΣΒ ὁ τοῦ ἀπὸ ΑΣ ἐστὶ πρὸς τὸ ὑπὸ ΒΣΓ, ὁ δὲ τῆς ΑΤ πρὸς ΤΕ μετὰ τοῦ τῆς ΑΤ πρὸς ΤΟ ὁ τοῦ ἀπὸ ΑΤ πρὸς τὸ ὑπὸ ΕΤΟ. ἔστιν ἄρα ὡς τὸ ἀπὸ ΑΣ πρὸς τὸ ὑπὸ ΒΣΓ, οὕτως τὸ ἀπὸ ΑΤ πρὸς τὸ ὑπὸ ΕΤΟ. καὶ ἐστὶν ὡς μὲν τὸ ἀπὸ ΑΣ πρὸς τὸ ὑπὸ ΒΣΓ, ἡ ΘΕ πρὸς ΕΠ, ὡς δὲ τὸ ἀπὸ ΑΤ πρὸς τὸ ὑπὸ ΕΤΟ, ἡ ΘΕ πρὸς ΘΡ. καὶ ὡς ἄρα ἡ ΘΕ πρὸς ΕΠ, ἡ ΕΘ πρὸς ΘΡ. ἴση ἄρα ἐστὶν ἡ ΕΠ τῇ ΘΡ.

(vi.) *Transition to New Diameter*

ν'

Ἐὰν ὑπερβολῆς ἡ ἐλλείψεως ἡ κύκλου περιφερείας εὐθεῖα ἐπιψαύουσαι συμπίπτῃ τῇ διαμέτρῳ, καὶ διὰ τῆς ἀφῆς καὶ τοῦ κέντρου εὐθεῖα ἐκβληθῇ, ἀπὸ δὲ τῆς κορυφῆς ἀναχθεῖσα εὐθεῖα παρὰ τεταγμένως κατηγμένην συμπίπτῃ τῇ διὰ τῆς ἀφῆς καὶ

* Apollonius is the first person known to have recognized the opposite branches of a hyperbola as portions of the same

APOLLONIUS OF PERGA

transverse side of the figure [Prop. 12]. Similarly $H\Theta K$ is a hyperbola, in which ΘN is a diameter, ΘP is the parameter to the ordinates to ΘN , and ΘE is the transverse side of the figure.

I say that $\Theta P = E\Pi$. For since $B\Gamma$ is parallel to $E\Theta$,

$$A\Sigma : \Sigma\Gamma = AT : T\Xi,$$

and

$$A\Sigma : \Sigma B = AT : TO.$$

But

$$(A\Sigma : \Sigma\Gamma)(A\Sigma : \Sigma B) = A\Sigma^2 : B\Sigma \cdot \Sigma\Gamma,$$

and

$$(AT : T\Xi)(AT : TO) = AT^2 : \Xi T \cdot TO.$$

Therefore

$$A\Sigma^2 : B\Sigma \cdot \Sigma\Gamma = AT^2 : \Xi T \cdot TO.$$

But

$$A\Sigma^2 : B\Sigma \cdot \Sigma\Gamma = \Theta E : E\Pi,$$

while

$$AT^2 : \Xi T \cdot TO = \Theta E : \Theta P;$$

therefore

$$\Theta E : E\Pi = E\Theta : \Theta P.$$

Therefore

$$E\Pi = \Theta P.^a$$

[Eucl. v. 9]

(vi.) *Transition to New Diameter*

Ibid., Prop. 50, Apoll. Perg. ed. Heiberg i. 148. 17–154. 8

Prop. 50

In a hyperbola, ellipse or circumference of a circle let a straight line be drawn to touch [the curve] and meet the diameter, and let the straight line through the point of contact and the centre be produced, and from the vertex let a straight line be drawn parallel to a straight line drawn ordinate-wise so as to meet the straight line drawn

curve. It is his practice, however, where possible to discuss the single-branch hyperbola (or the hyperbola *simpliciter* as he would call it) together with the ellipse and circle, and to deal with the opposite branches separately. But occasionally, as in i. 30, the double-branch hyperbola and the ellipse are included in one enunciation.

τοῦ κέντρου ἡγμένη εὐθεία, καὶ ποιηθῇ, ὡς τὸ τμήμα τῆς ἐφαπτομένης τὸ μεταξὺ τῆς ἀφῆς καὶ τῆς ἀνηγμένης πρὸς τὸ τμήμα τῆς ἡγμένης διὰ τῆς ἀφῆς καὶ τοῦ κέντρου τὸ μεταξὺ τῆς ἀφῆς καὶ τῆς ἀνηγμένης, εὐθείά τις πρὸς τὴν διπλασίαν τῆς ἐφαπτομένης, ἥτις ἂν ἀπὸ τῆς τομῆς ἀχθῇ ἐπὶ τὴν διὰ τῆς ἀφῆς καὶ τοῦ κέντρου ἡγμένην εὐθείαν παράλληλος τῇ ἐφαπτομένη, δυνήσεται τι χωρίον ὀρθογώνιον παρακείμενον παρὰ τὴν πορισθεῖσαν, πλάτος ἔχον τὴν ἀπολαμβανομένην ὑπ' αὐτῆς πρὸς τῇ ἀφῇ, ἐπὶ μὲν τῆς ὑπερβολῆς ὑπερβάλλον εἶδει ὁμοίῳ τῷ περιεχομένῳ ὑπὸ τῆς διπλασίας τῆς μεταξὺ τοῦ κέντρου καὶ τῆς ἀφῆς καὶ τῆς πορισθείσης εὐθείας, ἐπὶ δὲ τῆς ἐλλείψεως καὶ τοῦ κύκλου ἐλλείπον.

Ἐστω ὑπερβολὴ ἢ ἐλλειψις ἢ κύκλου περιφέρεια, ἥς διάμετρος ἢ AB , κέντρον δὲ τὸ Γ , ἐφαπτομένη δὲ ἢ ΔE , καὶ ἐπιζευχθεῖσα ἢ ΓE ἐκβεβλήσθω ἐφ' ἑκάτερα, καὶ κείσθω τῇ $E\Gamma$ ἴση ἢ ΓK , καὶ διὰ τοῦ B τεταγμένως ἀνήχθω ἢ BZH , διὰ δὲ τοῦ E τῇ $E\Gamma$ πρὸς ὀρθὰς ἤχθω ἢ $E\Theta$, καὶ γινέσθω, ὡς ἢ ZE πρὸς EH , οὕτως ἢ $E\Theta$ πρὸς τὴν διπλασίαν τῆς $E\Delta$, καὶ ἐπιζευχθεῖσα ἢ ΘK ἐκβεβλήσθω, καὶ εἰλήφθω τι ἐπὶ τῆς τομῆς σημεῖον τὸ Λ , καὶ δι' αὐτοῦ τῇ $E\Delta$ παράλληλος ἤχθω ἢ $\Lambda M\Xi$, τῇ δὲ

^a To save space, the figure is here given for the hyperbola only; in the mss. there are figures for the ellipse and circle as well.

The general enunciation is not easy to follow, but the particular enunciation will make it easier to understand. The

APOLLONIUS OF PERGA

through the point of contact and the centre, and let the segment of the tangent between the point of contact and the line drawn ordinate-wise bear to the segment of the line drawn through the point of contact and the centre between the point of contact and the line drawn ordinate-wise the same ratio as a certain straight line bears to double the tangent; then if any straight line be drawn from the section parallel to the tangent so as to meet the straight line drawn through the point of contact and the centre, its square will be equal to a certain rectilineal area applied to the postulated straight line, having for its breadth the intercept between it and the point of contact, in the case of the hyperbola exceeding by a figure similar to the rectangle bounded by double the straight line between the centre and the point of contact and the postulated straight line, in the case of the ellipse and circle falling short.^a

In a hyperbola, ellipse or circumference of a circle, with diameter AB and centre Γ , let ΔE be a tangent, and let ΓE be joined and produced in either direction, and let ΓK be placed equal to $E\Gamma$, and through B let BZH be drawn ordinate-wise, and through E let $E\Theta$ be drawn perpendicular to $E\Gamma$, and let $ZE : EH = E\Theta : 2EA$, and let ΘK be joined and produced, and let any point Λ be taken on the section, and through it let $\Lambda M\Xi$ be drawn parallel to $E\Delta$ and purpose of this important proposition is to show that, if any other diameter be taken, the ordinate-property of the conic with reference to this diameter has the same form as the ordinate-property with reference to the original diameter. The theorem amounts to a transformation of co-ordinates from the original diameter and the tangent at its extremity to any diameter and the tangent at its extremity. In succeeding propositions, showing how to construct conics from certain data, Apollonius introduces the axes for the first time as special cases of diameters.

APOLLONIUS OF PERGA

ΔPN parallel to BH , and let $M\Pi$ be drawn parallel to $E\Theta$. I say that $\Delta M^2 = EM \cdot M\Pi$.

For through Γ let $\Gamma\Sigma\Theta$ be drawn parallel to $K\Pi$. Then since

$$E\Gamma = \Gamma K$$

and $E\Gamma : \Gamma K = E\Sigma : \Sigma\Theta$, [Eucl. vi. 2]

therefore $E\Sigma = \Sigma\Theta$.

And since $ZE : EH = \Theta E : 2E\Delta$,

and $E\Sigma = \frac{1}{2}E\Theta$,

therefore $ZE : EH = \Sigma E : E\Delta$.

But $ZE : EH = \Delta M : MP$; [Eucl. vi. 4]

therefore $\Delta M : MP = \Sigma E : E\Delta$.

And since it has been proved [Prop. 43] that in the hyperbola

triangle PNT = triangle HBT + triangle $\Delta N\Xi$,

i.e., triangle PNT = triangle $\Gamma\Delta E$ + triangle $\Delta N\Xi$,^a

while in the ellipse and the circle

triangle PNT = triangle HBT -
triangle $\Delta N\Xi$,

i.e., triangle PNT + triangle $\Delta N\Xi$ = triangle $\Gamma\Delta E$,^b

therefore by taking away the common elements—in the hyperbola the triangle $E\Gamma\Delta$ and the quadrilateral $NPM\Xi$, in the ellipse and the circle the triangle $M\Xi\Gamma$,

triangle ΔMP = quadrilateral $ME\Delta\Xi$.

^a For this step *v.* Eutocius's comment on Prop. 43.

^b See Eutocius.

παράλληλος ἡ ΜΞ τῇ ΔΕ, ἡ δὲ ὑπὸ ΛΜΡ τῇ ὑπὸ
 ΕΜΞ ἐστὶν ἴση· ἴσον ἄρα ἐστὶ τὸ ὑπὸ ΛΜΡ τῷ

 καὶ ἡ ΜΟ πρὸς ΕΣ, ὥς ἄρα ἡ ΜΟ πρὸς ΕΣ, ἡ
 ΜΞ πρὸς ΔΕ. καὶ συνθέντι, ὥς συναμφότερος ἡ
 ΜΟ, ΣΕ πρὸς ΕΣ, οὕτως συναμφότερος ἡ ΜΞ,
 ΕΔ πρὸς ΕΔ· ἐναλλάξ, ὥς συναμφότερος ἡ ΜΟ,
 ΣΕ πρὸς συναμφότερον τὴν ΕΜ, ΕΔ ἡ ΣΕ πρὸς
 ΕΔ. ἀλλ' ὥς μὲν συναμφότερος ἡ ΜΟ, ΕΣ πρὸς
 συναμφότερον τὴν ΜΞ, ΔΕ, τὸ ὑπὸ συναμφοτέρου
 τῆς ΜΟ, ΕΣ καὶ τῆς ΕΜ πρὸς τὸ ὑπὸ συναμφο-
 τέρου τῆς ΜΞ, ΕΔ καὶ τῆς ΕΜ, ὥς δὲ ἡ ΣΕ πρὸς
 ΕΔ, ἡ ΖΕ πρὸς ΕΗ, τουτέστιν ἡ ΛΜ πρὸς ΜΡ,
 τουτέστι τὸ ἀπὸ ΛΜ πρὸς τὸ ὑπὸ ΛΜΡ· ὥς ἄρα
 τὸ ὑπὸ συναμφοτέρου τῆς ΜΟ, ΕΣ καὶ τῆς ΜΞ
 πρὸς τὸ ὑπὸ συναμφοτέρου τῆς ΜΞ, ΕΔ καὶ τῆς
 ΕΜ, τὸ ἀπὸ ΛΜ πρὸς τὸ ὑπὸ ΛΜΡ. καὶ ἐναλλάξ,
 ὥς τὸ ὑπὸ συναμφοτέρου τῆς ΜΟ, ΕΣ καὶ τῆς
 ΜΞ πρὸς τὸ ἀπὸ ΜΛ, οὕτως τὸ ὑπὸ συναμφοτέρου
 τῆς ΜΞ, ΕΔ καὶ τῆς ΜΞ πρὸς τὸ ὑπὸ ΛΜΡ.
 ἴσον δὲ τὸ ὑπὸ ΛΜΡ τῷ ὑπὸ τῆς ΜΞ καὶ συναμφο-
 τέρου τῆς ΜΞ, ΕΔ· ἴσον ἄρα καὶ τὸ ἀπὸ ΛΜ τῷ
 ὑπὸ ΕΜ καὶ συναμφοτέρου τῆς ΜΟ, ΕΣ. καὶ
 ἐστὶν ἡ μὲν ΣΕ τῇ ΣΘ ἴση, ἡ δὲ ΣΘ τῇ ΟΠ· ἴσον
 ἄρα τὸ ἀπὸ ΛΜ τῷ ὑπὸ ΕΜΠ.

APOLLONIUS OF PERGA

But $MΞ$ is parallel to $ΔE$ and angle $ΔMP = \text{angle } EMΞ$ (Eucl. i. 15] ;

therefore $ΔM \cdot MP = EM \cdot (EΔ + MΞ).$

And since $MΓ : ΓE = MΞ : EΔ,$

and $MΓ : ΓE = MO : EΣ,$
[Eucl. vi. 4

therefore $MO : EΣ = MΞ : EΔ.$

Componendo, $MO + ΣE : EΣ = MΞ + EΔ : EΔ ;$

and *permutando*

$$MO + ΣE : ΞM + EΔ = ΣE : EΔ.$$

But $MO + ΣE : ΞM + EΔ = (MO + EΣ) \cdot EM : (MΞ + EΔ) \cdot EM,$

and $ΣE : EΔ = ZE : EH$
 $= ΔM : MP$
[Eucl. vi. 4
 $= ΔM^2 : ΔM \cdot MP ;$

therefore

$$(MO + EΣ) \cdot ME : (MΞ + EΔ) \cdot EM = ΔM^2 : ΔM \cdot MP.$$

And *permutando*

$$(MO + EΣ) \cdot ME : ΔM^2 = (MΞ + EΔ) \cdot ME : ΔM \cdot MP.$$

But $ΔM \cdot MP = ME \cdot (MΞ + EΔ) ;$

therefore $ΔM^2 = EM \cdot (MO + EΣ).$

And $ΣE = ΣΘ$, while $ΣΘ = OΠ$ [Eucl. i. 34] ;

therefore $ΔM^2 = EM \cdot MΠ.$

APOLLONIUS OF PERGA

(b) OTHER WORKS

(i.) *General*

Pappus, *Collection* vii. 3, ed. Hultsch 636. 18-23

The order of the aforesaid books in the *Treasury of Analysis* is as follows: the one book of Euclid's *Data*, the two books of Apollonius's *On the Cutting-off of a Ratio*, his two books *On the Cutting-off of an Area*, his two books *On Determinate Section*, his two books *On Tangencies*, the three books of Euclid's *Porisms*, the two books of Apollonius's *On Vergings*, the two books of the same writer *On Plane Loci*, his eight books of *Conics*.^a

(ii.) *On the Cutting-off of a Ratio*

Ibid. vii. 5-6, ed. Hultsch 640. 4-22

In the two books *On the Cutting-off of a Ratio* there is one enunciation which is subdivided, for which reason I state one enunciation thus: *Through a given point to draw a straight line cutting off from two straight lines given in position intercepts, measured from two given points on them, which shall have a given ratio.* When the subdivision is made, this leads to many different figures according to the position of the given straight lines in relation one to another and according to the different cases of the given point, and owing to the analysis and the synthesis both of these cases and of the propositions determining the limits of possibility. The first book of those *On the Cutting-off of a*

Ratio, and that only in Arabic. Halley published a Latin translation in 1706. But the contents of the other works are indicated fairly closely by Pappus's references.

τόπους ξ , πτώσεις $\overline{\kappa\delta}$, διορισμούς δὲ ϵ , ὧν τρεῖς μὲν εἰσιν μέγιστοι, δύο δὲ ἐλάχιστοι. . . . τὸ δὲ δεύτερον βιβλίον Λόγου ἀποτομῆς ἔχει τόπους $\overline{\iota\delta}$, πτώσεις δὲ $\overline{\xi\gamma}$, διορισμούς δὲ τοὺς ἐκ τοῦ πρώτου ἀπάγεται γὰρ ὅλον εἰς τὸ πρῶτον.

(iii.) *On the Cutting-off of an Area*

Ibid. vii. 7, ed. Hultsch 640. 26-642. 5

Τῆς δ' Ἀποτομῆς τοῦ χωρίου βιβλία μὲν ἔστιν δύο, πρόβλημα δὲ καὶ τούτοις ἐν ὑποδιαιρούμενον δῖς, καὶ τούτων μία πρότασις ἔστιν τὰ μὲν ἄλλα ὁμοίως ἔχουσα τῇ προτέρᾳ, μόνῳ δὲ τούτῳ διαφέρουσα τῷ δεῖν τὰς ἀποτεμνομένας δύο εὐθείας ἐν ἐκείνῃ μὲν λόγον ἐχούσας δοθέντα ποιεῖν, ἐν δὲ ταύτῃ χωρίον περιεχούσας δοθέν.

(iv.) *On Determinate Section*

Ibid. vii. 9, ed. Hultsch 642. 19-644. 16

Ἐξῆς τούτοις ἀναδέδονται τῆς Διωρισμένης τομῆς βιβλία β , ὧν ὁμοίως τοῖς πρότερον μίαν πρότασιν πάρεστιν λέγειν, διεξευγμένην δὲ ταύτην.

^a The Arabic text shows that Apollonius first discussed the cases in which the lines are parallel, then the cases in which the lines intersect but one of the given points is at the point of intersection ; in the second book he proceeds to the general case, but shows that it can be reduced to the case where one

APOLLONIUS OF PERGA

Ratio contains seven loci, twenty-four cases and five determinations of the limits of possibility, of which three are maxima and two are minima. . . . The second book *On the Cutting-off of a Ratio* contains fourteen loci, sixty-three cases and the same determinations of the limits of possibility as the first; for they are all reduced to those in the first book.^a

(iii.) *On the Cutting-off of an Area*

Ibid. vii. 7, ed. Hultsch 640. 26-642. 5

In the work *On the Cutting-off of an Area* there are two books, but in them there is only one problem, twice subdivided, and the one enunciation is similar in other respects to the preceding, differing only in this, that in the former work the intercepts on the two given lines were required to have a given ratio, in this to comprehend a given area.^b

(iv.) *On Determinate Section*

Ibid. vii. 9, ed. Hultsch 642. 19-644. 16

Next in order after these are published the two books *On Determinate Section*, of which, as in the previous cases, it is possible to state one comprehensive of the given points is at the intersection of the two lines. By this means the problem is reduced to the application of a rectangle. In all cases Apollonius works by analysis and synthesis.

^b Halley attempted to restore this work in his edition of the *De sectione rationis*. As in that treatise, the general case can be reduced to the case where one of the given points is at the intersection of the two lines, and the problem is reduced to the application of a certain rectangle.

τὴν δοθείσαν ἄπειρον εὐθείαν ἐνὶ σημείῳ τεμείν, ὥστε τῶν ἀπολαμβανομένων εὐθειῶν πρὸς τοῖς ἐπ' αὐτῆς δοθείσι σημείοις ἦτοι τὸ ἀπὸ μιᾶς τετράγωνον ἢ τὸ ὑπὸ δύο ἀπολαμβανομένων περιεχόμενον ὀρθογώνιον δοθέντα λόγον ἔχειν ἦτοι πρὸς τὸ ἀπὸ μιᾶς τετράγωνον ἢ πρὸς τὸ ὑπὸ μιᾶς ἀπολαμβανομένης καὶ τῆς ἕξω δοθείσης ἢ πρὸς τὸ ὑπὸ δύο ἀπολαμβανομένων περιεχόμενον ὀρθογώνιον, ἐφ' ὁποῦτα χρὴ τῶν δοθέντων σημείων. . . ἔχει δὲ τὸ μὲν πρῶτον βιβλίον προβλήματα $\bar{\epsilon}$, ἐπιτάγματα $\bar{\iota}\bar{\varsigma}$, διορισμοὺς $\bar{\epsilon}$, ὧν μεγίστους μὲν δ , ἐλάχιστον δὲ ἓνα. . . τὸ δὲ δεῦτερον Διωρισμένης τομῆς ἔχει προβλήματα $\bar{\gamma}$, ἐπιτάγματα $\bar{\theta}$, διορισμοὺς $\bar{\gamma}$.

(v.) *On Tangencies*

Ibid. vii. 11, ed. Hultsch 644. 23-646. 19

Ἐξῆς δὲ τούτοις τῶν Ἑπαφῶν ἐστὶν βιβλία δύο. προτάσεις δὲ ἐν αὐτοῖς δοκοῦσιν εἶναι πλείονες, ἀλλὰ καὶ τούτων μίαν τίθεμεν οὕτως ἔχουσιν ἐξῆς· σημείων καὶ εὐθειῶν καὶ κύκλων τριῶν ὁποιωνοῦν θέσει δοθέντων κύκλον ἀγαγεῖν δι' ἐκάστου τῶν δοθέντων σημείων, εἰ δοθείη, ἢ ἐφαπτόμενον ἐκάστης τῶν δοθεισῶν γραμμῶν. ταύτης διὰ

^a As the Greeks never grasped the conception of one point being two *coincident* points, it was not possible to enunciate this problem so concisely as we can do: *Given four points A, B, C, D on a straight line, of which A may coincide with C and B with D, to find another point P on the same straight line such that AP · CP : BP · DP has a given value.* If $AP \cdot CP = \lambda \cdot BP \cdot DP$, where A, B, C, D, λ are given, the determination of P is equivalent to the solution of a quadratic equation, which the Greeks could achieve by means of the

APOLLONIUS OF PERGA

sive enunciation thus: *To cut a given infinite straight line in a point so that the intercepts between this point and given points on the line shall furnish a given ratio, the ratio being that of the square on one intercept, or the rectangle contained by two, towards the square on the remaining intercept, or the rectangle contained by the remaining intercept and a given independent straight line, or the rectangle contained by two remaining intercepts, whichever way the given points [are situated]. . . .* The first book contains six problems, sixteen subdivisions and five limits of possibility, of which four are maxima and one is a minimum. . . . The second book *On Determinate Section* contains three problems, nine subdivisions, and three limits of possibility.^a

(v.) *On Tangencies*

Ibid. vii. 11, ed. Hultsch 644, 23-646. 19

Next in order are the two books *On Tangencies*. Their enunciations are more numerous, but we may bring these also under one enunciation thus stated: *Given three entities, of which any one may be a point or a straight line or a circle, to draw a circle which shall pass through each of the given points, so far as it is points which are given, or to touch each of the given lines.*^b In

application of areas. But the fact that limits of possibility, and maxima and minima were discussed leads Heath (*H.G.M.* ii. 180-181) to conjecture that Apollonius investigated the series of point-pairs determined by the equation for different values of λ , and that "the treatise contained what amounts to a complete *Theory of Involution*." The importance of the work is shown by the large number of lemmas which Pappus collected.

^b The word "lines" here covers both the straight lines and the circles.

πλήθη τῶν ἐν ταῖς ὑποθέσεσι δεδομένων ὁμοίων ἢ ἀνομοίων κατὰ μέρος διαφόρους προτάσεις ἀναγκαῖον γίνεσθαι δέκα· ἐκ τῶν τριῶν γὰρ ἀνομοίων γενῶν τριάδες διάφοροι ἄτακτοι γίνονται ἑ. ἦτοι γὰρ τὰ διδόμενα τρία σημεῖα ἢ τρεῖς εὐθεῖαι ἢ δύο σημεῖα καὶ εὐθεῖα ἢ δύο εὐθεῖαι καὶ σημεῖον ἢ δύο σημεῖα καὶ κύκλος ἢ δύο κύκλοι καὶ σημεῖον ἢ δύο εὐθεῖαι καὶ κύκλος ἢ δύο κύκλοι καὶ εὐθεῖα ἢ σημεῖον καὶ εὐθεῖα καὶ κύκλος ἢ τρεῖς κύκλοι. τούτων δύο μὲν τὰ πρῶτα δέδεικται ἐν τῷ δ' βιβλίῳ τῶν πρώτων Στοιχείων, διὸ παρίει μὴ γράφων· τὸ μὲν γὰρ τριῶν δοθέντων σημείων μὴ ἐπ' εὐθείας ὄντων τὸ αὐτὸ ἐστίν· τῷ περὶ τὸ δοθὲν τρίγωνον κύκλον περιγράψαι, τὸ δὲ γ' δοθεισῶν εὐθειῶν μὴ παραλλήλων οὐσῶν, ἀλλὰ τῶν τριῶν συμπιπτουσῶν, τὸ αὐτὸ ἐστίν τῷ εἰς τὸ δοθὲν τρίγωνον κύκλον ἐγγράψαι· τὸ δὲ δύο παραλλήλων οὐσῶν καὶ μιᾶς ἐμπιπτούσης ὡς μέρος ὄν τῆς β' ὑποδιαίρέσεως προγράφεται ἐν τούτοις πάντων. καὶ τὰ ἐξῆς ε' ἐν τῷ πρώτῳ βιβλίῳ τὰ δὲ λειπόμενα δύο, τὸ δύο δοθεισῶν εὐθειῶν καὶ κύκλου ἢ τριῶν δοθέντων κύκλων μόνον ἐν τῷ δευτέρῳ βιβλίῳ διὰ τὰς πρὸς ἀλλήλους θέσεις τῶν κύκλων τε καὶ εὐθειῶν πλείονας οὕσας καὶ πλείονων διορισμῶν δεομένας.

^a Eucl. iv. 5 and 4.

^b The last problem, to describe a circle touching three

APOLLONIUS OF PERGA

this problem, according to the number of like or unlike entities in the hypotheses, there are bound to be, when the problem is subdivided, ten enunciations. For the number of different ways in which three entities can be taken out of the three unlike sets is ten. For the given entities must be (1) three points or (2) three straight lines or (3) two points and a straight line or (4) two straight lines and a point or (5) two points and a circle or (6) two circles and a point or (7) two straight lines and a circle or (8) two circles and a straight line or (9) a point and a straight line and a circle or (10) three circles. Of these, the first two cases are proved in the fourth book of the first *Elements*,^a for which reason they will not be described; for to describe a circle through three points, not being in a straight line, is the same thing as to circumscribe a given triangle, and to describe a circle to touch three given straight lines, not being parallel but meeting each other, is the same thing as to inscribe a circle in a given triangle; the case where two of the lines are parallel and one meets them is a subdivision of the second problem but is here given first place. The next six problems in order are investigated in the first book, while the remaining two, the case of two given straight lines and a circle and the case of three circles, are the sole subjects of the second book on account of the manifold positions of the circles and straight lines with respect one to another and the need for numerous investigations of the limits of possibility.^b

given circles, has been investigated by many famous geometers, including Newton (*Arithmetica Universalis*, Prob. 47). The lemmas given by Pappus enable Heath (*H.G.M.* ii. 182-185) to restore Apollonius's solution—a "plane" solution depending only on the straight line and circle.

GREEK MATHEMATICS

(vi.) *On Plane Loci*

Ibid. vii. 23, ed. Hultsch 662. 19-664. 7

Οἱ μὲν οὖν ἀρχαῖοι εἰς τὴν τῶν ἐπιπέδων τούτων¹ τόπων τάξιν ἀποβλέποντες ἐστοιχείωσαν· ἥς ἀμελήσαντες οἱ μετ' αὐτοὺς προσέθηκαν ἑτέρους, ὡς οὐκ ἀπείρων τὸ πλῆθος ὄντων, εἰ θέλοι τις προσγράφειν οὐ τῆς τάξεως ἐκείνης ἐχόμενα. θήσω οὖν τὰ μὲν προσκείμενα ὕστερα, τὰ δ' ἐκ τῆς τάξεως πρότερα μιᾷ περιλαβὼν προτάσει ταύτη·

Ἐὰν δύο εὐθεῖαι ἀχθῶσιν ἥτοι ἀπὸ ἐνὸς δεδομένου σημείου ἢ ἀπὸ δύο καὶ ἥτοι ἐπ' εὐθείας ἢ παράλληλοι ἢ δεδομένην περιέχουσαι γωνίαν καὶ ἥτοι λόγον ἔχουσαι πρὸς ἀλλήλας ἢ χωρίον περιέχουσαι δεδομένον, ἄπτηται δὲ τὸ τῆς μιᾶς πέρας ἐπιπέδου τόπου θέσει δεδομένου, ἄψεται καὶ τὸ τῆς ἑτέρας πέρας ἐπιπέδου τόπου θέσει δεδομένου ὅτε μὲν τοῦ ὁμογενοῦς, ὅτε δὲ τοῦ ἑτέρου, καὶ ὅτε μὲν ὁμοίως κειμένου πρὸς τὴν εὐθεῖαν, ὅτε δὲ ἐναντίως. ταῦτα δὲ γίνεται παρὰ τὰς διαφορὰς τῶν ὑποκειμένων.

(vii.) *On Vergings*

Ibid. vii. 27-28, ed. Hultsch 670. 4-672. 3

Νεύειν λέγεται γραμμὴ ἐπὶ σημεῖον, εἰὰν ἐπεκβαλλομένη ἐπ' αὐτὸ παραγίνηται [. . .]

¹ τούτων is attributed by Hultsch to dittography.

^a These words follow the passage (quoted *supra*, pp. 362-265) wherein Pappus divides loci into ἐφεκτικοί, διεξοδικοί and ἀναστροφικοί.

^b It is not clear what straight line is meant—probably the most obvious straight line in each figure.

APOLLONIUS OF PERGA

(vi.) *On Plane Loci*

Ibid. vii. 23, ed. Hultsch 662. 19-664. 7

The ancients had regard to the arrangement^a of these plane loci with a view to instruction in the elements; heedless of this consideration, their successors have added others, as though the number could not be infinitely increased if one were to make additions from outside that arrangement. Accordingly I shall set out the additions later, giving first those in the arrangement, and including them in this single enunciation:

If two straight lines be drawn, from one given point or from two, which are in a^a straight line or parallel or include a given angle, and either bear a given ratio one towards the other or contain a given rectangle, then, if the locus of the extremity of one of the lines be a plane locus given in position, the locus of the extremity of the other will also be a plane locus given in position, which will sometimes be of the same kind as the former, sometimes of a different kind, and will sometimes be similarly situated with respect to the straight line,^b sometimes contrariwise. These different cases arise according to the differences in the suppositions.^c

(vii.) *On Vergings*^a

Ibid. vii. 27-28, ed. Hultsch 670. 4-672. 3

A line is said to *verge* to a point if, when produced, it passes through the point. [. . .] The general

^a Pappus proceeds to give seven other enunciations from the first book and eight from the second book. These have enabled reconstructions of the work to be made by Fermat, van Schooten and Robert Simson.

^a Examples of vergings have already been encountered several times; r. pp. 186-189 and vol. i. p. 244 n. a.

προβλήματος δὲ ὄντος καθολικοῦ τούτου· δύο δοθεισῶν γραμμῶν θέσει θεῖναι μεταξὺ τούτων εὐθεῖαν τῷ μεγέθει δεδομένην νεύουσαν ἐπὶ δοθὲν σημείον, ἐπὶ τούτου τῶν ἐπὶ μέρους διάφορα τὰ ὑποκείμενα ἔχόντων, ἃ μὲν ἦν ἐπίπεδα, ἃ δὲ στερεά, ἃ δὲ γραμμικά, τῶν δ' ἐπιπέδων ἀποκληρώσαντες τὰ πρὸς πολλὰ χρησιμώτερα ἔδειξαν τὰ προβλήματα ταῦτα·

Θέσει δεδομένων ἡμικυκλίου τε καὶ εὐθείας πρὸς ὀρθὰς τῇ βάσει ἢ δύο ἡμικυκλίων ἐπ' εὐθείας ἔχόντων τὰς βάσεις θεῖναι δοθεῖσαν τῷ μεγέθει εὐθεῖαν μεταξὺ τῶν δύο γραμμῶν νεύουσαν ἐπὶ γωνίαν ἡμικυκλίου·

Καὶ ῥόμβου δοθέντος καὶ ἐπεκβεβλημένης μιᾶς πλευρᾶς ἀρμόσαι ὑπὸ τὴν ἐκτὸς γωνίαν δεδομένην τῷ μεγέθει εὐθεῖαν νεύουσαν ἐπὶ τὴν ἀντικρυς γωνίαν·

Καὶ θέσει δοθέντος κύκλου ἐναρμόσαι εὐθεῖαν μεγέθει δεδομένην νεύουσαν ἐπὶ δοθέν·

Τούτων δὲ ἐν μὲν τῷ πρώτῳ τεύχει δέδεικται τὸ ἐπὶ τοῦ ἐνὸς ἡμικυκλίου καὶ εὐθείας ἔχον πτώσεις δ καὶ τὸ ἐπὶ τοῦ κύκλου ἔχον πτώσεις δύο καὶ τὸ ἐπὶ τοῦ ῥόμβου πτώσεις ἔχον β, ἐν δὲ τῷ δευτέρῳ τεύχει τὸ ἐπὶ τῶν δύο ἡμικυκλίων τῆς ὑποθέσεως πτώσεις ἐχούσης ι, ἐν δὲ ταύταις ὑποδιαίρέσεις πλείονες διοριστικαὶ ἔνεκα τοῦ δεδομένου μεγέθους τῆς εὐθείας.

APOLLONIUS OF PERGA

problem is: *Two straight lines being given in position, to place between them a straight line of given length so as to verge to a given point.* When it is subdivided the subordinate problems are, according to differences in the suppositions, sometimes plane, sometimes solid, sometimes linear. Among the plane problems, a selection was made of those more generally useful, and these problems have been proved:

Given a semicircle and a straight line perpendicular to the base, or two semicircles with their bases in a straight line, to place a straight line of given length between the two lines and verging to an angle of the semicircle [or of one of the semicircles];

Given a rhombus with one side produced, to insert a straight line of given length in the external angle so that it verges to the opposite angle;

Given a circle, to insert a chord of given length verging to a given point.

Of these, there are proved in the first book four cases of the problem of one semicircle and a straight line, two cases of the circle, and two cases of the rhombus; in the second book there are proved ten cases of the problem in which two semicircles are assumed, and in these there are numerous subdivisions concerned with limits of possibility according to the given length of the straight line.^a

^a A restoration of Apollonius's work *On Vergings* has been attempted by several writers, most completely by Samuel Horsley (Oxford, 1770). A lemma by Pappus enables Apollonius's construction in the case of the rhombus to be restored with certainty; v. Heath, *H.G.M.* ii. 190-192.

APOLLONIUS OF PERGA

(viii.) *On the Dodecahedron and the Icosahedron*

Hypsicles [Euclid, *Elements* xiv.],^a Eucl. ed. Heiberg
v. 6. 19-8. 5

The pentagon of the dodecahedron and the triangle of the icosahedron ^b inscribed in the same sphere can be included in the same circle. For this is proved by Aristaeus in the work which he wrote *On the Comparison of the Five Figures*,^c and it is proved by Apollonius in the second edition of his work *On the Comparison of the Dodecahedron and the Icosahedron* that the surface of the dodecahedron bears to the surface of the icosahedron the same ratio as the volume of the dodecahedron bears to the volume of the icosahedron, by reason of there being a common perpendicular from the centre of the sphere to the pentagon of the dodecahedron and the triangle of the icosahedron.

(ix.) *Principles of Mathematics*

Marinus, *Commentary on Euclid's Data*, Eucl. ed.
Heiberg vi. 234. 13-17

Therefore, among those who made it their aim to define the datum more simply and with a single *differentia*, some called it the *assigned*, such as Apollonius in his book *On Vergings* and in his

^a The so-called fourteenth book of Euclid's *Elements* is really the work of Hypsicles, for whom v. *infra*, pp. 394-397.

^b For the regular solids v. vol. i. pp. 216-225. The face of the dodecahedron is a pentagon and the face of the icosahedron a triangle.

^c A proof is given by Hypsicles as Prop. 2 of his book. Whether the Aristaeus is the same person as the author of the *Solid Loci* is not known.

Papp. *Coll.* ii. 17-21, ed. Hultsch 18. 23-24. 20¹

Τούτου δὴ προτε θεωρημένου πρόδηλον, πῶς ἔστιν τὸν δοθέντα στίχον πολλαπλασιάσαι καὶ εἰπεῖν τὸν γενόμενον ἀριθμὸν ἐκ τοῦ τὸν πρῶτον ἀριθμὸν ὃν εἴληφε τὸ πρῶτον τῶν γραμμάτων ἐπὶ τὸν δεῦτερον ἀριθμὸν ὃν εἴληφε τὸ δεῦτερον τῶν γραμμάτων πολλαπλασιασθῆναι καὶ τὸν γενόμενον ἐπὶ τὸν τρίτον ἀριθμὸν ὃν εἴληφε τὸ τρίτον γράμμα

¹ The extensive interpolations are omitted.

^a Pappus's commentary on Eucl. *Elem.* x. was discovered in an Arabic translation by Woepcke (*Mémoires présentées par divers savans à l'Académie des sciences*, 1856, xiv.). It contains several references to Apollonius's work, of which one is thus translated by Woepcke (p. 693): "Enfin, Apollonius distingue les espèces des irrationnelles ordonnées, et 352

APOLLONIUS OF PERGA

an infinite number of irrationals are formed, of which latter Apollonius also describes some.^a

(xii.) *Measurement of a Circle*

Eutocius, *Commentary on Archimedes' Measurement of a Circle*, Archim. ed. Heiberg iii. 258. 16-22

It should be noticed, however, that Apollonius of Perga proved the same thing (sc. the ratio of the circumference of a circle to the diameter) in the *Quick-deliverer* by a different calculation leading to a closer approximation. This appears to be more accurate, but it is of no use for Archimedes' purpose; for we have stated that his purpose in this book was to find an approximation suitable for the everyday needs of life.^b

(xiii.) *Continued Multiplications* ^c

Pappus, *Collection* ii. 17-21, ed. Hultsch 18. 23-24. 20^d

This theorem having first been proved, it is clear how to multiply together a given verse and to tell the number which results when the number represented by the first letter is multiplied into the number represented by the second letter and the product is multiplied into the number represented by the third

découvrit la science des quantités appelées (irrationnelles) inordonnées, dont il produisit un très-grand nombre par des méthodes exactes."

^b We do not know what the approximation was.

^c Heiberg (Apollon. Perg. ed. Heiberg ii. 124, n. 1) suggests that these calculations were contained in the *Μετρίκιον*, but there is no definite evidence.

^d The passages, chiefly detailed calculations, adjudged by Hultsch to be interpolations are omitted.

$$\begin{array}{c} \bar{\alpha} \bar{\gamma} \bar{\beta} \bar{\gamma} \bar{\alpha} \bar{\gamma} \bar{\beta} \bar{\varsigma} \bar{\delta} \bar{\alpha} \\ \bar{\delta} \bar{\alpha} \bar{\zeta} \bar{\beta} \bar{\gamma} \bar{\alpha} \bar{\beta} \bar{\zeta} \bar{\varsigma} \bar{\zeta} \bar{\epsilon} \bar{\epsilon} \bar{\epsilon} \bar{\beta} \bar{\zeta} \bar{\alpha}, \end{array}$$

* Apollonius, it is clear from Pappus, had a system of *tetrads* for calculations involving big numbers, the unit being the *myriad* or fourth power of 10. The tetrads are called *μυριάδες ἀπλᾶί*, *μυριάδες διπλαῖ*, *μυριάδες τριπλαῖ*, *simple myriads*, *double myriads*, *triple myriads* and so on, by which are meant 10000, 10000², 10000³ and so on. In the text of 354

APOLLONIUS OF PERGA

letter and so on in order until the end of the verse which Apollonius gave in the beginning, that is

Ἀρτέμιδος κλείτε κράτος ἔξοχον ἐννέα κοῦραι

(where he says κλείτε for ὑπομνήσατε, *recall to mind*).

Since there are thirty-eight letters in the verse, of which ten, namely $\bar{\rho} \bar{\tau} \bar{\sigma} \bar{\tau} \bar{\rho} \bar{\tau} \bar{\sigma} \bar{\chi} \bar{\upsilon} \bar{\rho}$ (=100, 300, 200, 300, 100, 300, 200, 600, 400, 100), represent numbers less than 1000 and divisible by 100, and seventeen, namely $\bar{\mu} \bar{\iota} \bar{\omicron} \bar{\kappa} \bar{\lambda} \bar{\iota} \bar{\kappa} \bar{\omicron} \bar{\xi} \bar{\omicron} \bar{\omicron} \bar{\nu} \bar{\nu} \bar{\kappa} \bar{\omicron} \bar{\iota}$ (=40, 10, 70, 20, 30, 10, 20, 70, 60, 70, 70, 50, 50, 50, 20, 70, 10), represent numbers less than 100 and divisible by 10, while the remaining eleven, namely, $\bar{a} \bar{\epsilon} \bar{\delta} \bar{\epsilon} \bar{\epsilon} \bar{a} \bar{\epsilon} \bar{\epsilon} \bar{a} \bar{a}$ (=1, 5, 4, 5, 5, 1, 5, 5, 5, 1, 1), represent numbers less than 10, then if for those ten numbers we substitute an equal number of hundreds, and if for the seventeen numbers we similarly substitute seventeen tens, it is clear from the above arithmetical theorem, the twelfth, that the ten hundreds together with the seventeen tens make $10 \cdot 10000^9$.

And since the bases of the numbers divisible by 100 and those divisible by 10 are the following twenty-seven

1, 3, 2, 3, 1, 3, 2, 6, 4, 1
4, 1, 7, 2, 3, 1, 2, 7, 6, 7, 7, 5, 5, 5, 2, 7, 1,

Pappus they are sometimes abbreviated to μ^a , μ^b , μ^c and so on.

From Pappus, though the text is defective, Apollonius's procedure in multiplying together powers of 10 can be seen to be equivalent to adding the indices of the separate powers of 10, and then dividing by 4 to obtain the power of the myriad which the product contains. If the division is exact, the number is the n -myriad, say, meaning 10000^n . If there is a remainder, 3, 2 or 1, the number is 1000, 100 or 10 times the n -myriad as the case may be.

APOLLONIUS OF PERGA

while there are eleven less than ten, that is the numbers

1, 5, 4, 5, 5, 1, 5, 5, 5, 1, 1,

if we multiply together the solid number formed by these eleven with the solid number formed by the twenty-seven the result will be the solid number

$$19 \cdot 10000^4 + 6036 \cdot 10000^3 + 8480 \cdot 10000^2.$$

When these numbers are multiplied into the solid number formed by the hundreds and the tens, that is with $10 \cdot 10000^9$ as calculated above, the result is

$$196 \cdot 10000^{13} + 368 \cdot 10000^{12} + 4800 \cdot 10000^{11}.$$

(xiv.) *On the Burning Mirror*

Fragmentum mathematicum Bobiense 113, 28-33,^a ed.
Belger, *Hermes*, xvi., 1881, 279-280

The older geometers thought that the burning took place at the centre of the mirror, but Apollonius very suitably showed this to be false . . . in his work on mirrors, and he explained clearly where the kindling takes place in his works *On the Burning Mirror*.^b

^a This fragment is attributed to Anthemius by Heiberg, but his assignment a century ago (see *H.G.M.* ii. 194) to suppose the title much earlier.

^b Cf. Apollonius' *conica* (see above), his solution of the problem of finding two mean proportionals has already been mentioned (*vol. ii.* p. 387 n. 1) and is fully and satisfactorily introduced; for his *conica* work the reader is referred to Heath, *H.G.M.* ii. 196-197.

XX. LATER DEVELOPMENTS IN GEOMETRY ^a

(a) CLASSIFICATION OF CURVES

Proclus, *On Euclid* i., ed. Friedlein 111. 1-112. 11

GEMINUS first divides lines into the *incomposite* and the *composite*, meaning by composite the broken line forming an angle; and then he divides the incomposite into those *forming a figure* and those *extending without limit*, including among those forming a figure the circle, the ellipse and the cissoid, and among those not forming a figure the parabola, the hyperbola, the conchoid, the straight line, and all such lines. Again, in another manner he says that some incomposite lines are *simple*, others *mixed*, and among the simple are some *forming a figure*, such as the circle, and others *indeterminate*, such as the straight line, while the mixed include both *lines on planes* and *lines on solids*, and among the lines on planes are lines *meeting themselves*, such as the cissoid, and others *extending without limit*, and among lines on solids are

the limits imposed by their methods, and the recorded additions to the corpus of Greek mathematics may be described as reflections upon existing work or "stock-taking." On the basis of geometry, however, the new sciences of trigonometry and mensuration were founded, as will be described, and the revival of geometry by Pappus will also be reserved for separate treatment.

τὴν μὲν κατὰ τὰς τομὰς ἐπινοεῖσθαι τῶν στερεῶν, τὴν δὲ περὶ τὰ στερεὰ ὑφίστασθαι. τὴν μὲν γὰρ ἔλिका τὴν περὶ σφαῖραν ἢ κῶνον περὶ τὰ στερεὰ ὑφεισθάναι, τὰς δὲ κωνικάς τομὰς ἢ τὰς σπειρικές ἀπὸ τοιαύδε τομῆς γεννᾶσθαι τῶν στερεῶν. ἐπινοηθῆναι δὲ ταύτας τὰς τομὰς τὰς μὲν ὑπὸ Μεναιχμοῦ τὰς κωνικάς, ὃ καὶ Ἑρατοσθένους ἱστορῶν λέγει· “μὴ δὲ Μεναιχμίους κωνοτομεῖν τριάδας”. τὰς δὲ ὑπὸ Περσέως, ὃς καὶ τὸ ἐπίγραμμα ἐποίησεν ἐπὶ τῇ εὐρέσει—

Τρεῖς γραμμάς ἐπὶ πέντε τομαῖς εὐρῶν ἑλικώδεις¹
Περσεὺς τῶν δ' ἔνεκεν δαίμονας ἰλάσατο.

αἱ μὲν δὴ τρεῖς τομαὶ τῶν κόνων εἰσὶν παραβολὴ καὶ ὑπερβολὴ καὶ ἔλλειψις, τῶν δὲ σπειρικών τομῶν ἡ μὲν ἐστὶν ἐμπεπλεγμένη, εὐκυκλία τῇ τοῦ ἵππου πέδῃ, ἡ δὲ κατὰ τὰ μέσα πλατύνεται, ἐξ ἑκατέρου δὲ ἀπολήγει μέρους, ἡ δὲ παραμήκης οὖσα τῷ μὲν μέσῳ διαστήματι ἐλάττονι χρῆται, εὐρύνεται δὲ ἐφ' ἑκάτερα. τῶν δὲ ἄλλων μίξεων τὸ πλῆθος ἀπέραντόν ἐστιν· καὶ γὰρ στερεῶν σχημάτων πλῆθος ἐστὶν ἄπειρον καὶ τομαὶ αὐτῶν συνίστανται πολυειδεῖς.

^b For Perseus, v. p. 364 n. a and p. 365 n. b.

LATER DEVELOPMENTS IN GEOMETRY

lines conceived as *formed by sections* of the solids and lines *formed round the solids*. The helix round the sphere or cone is an example of the lines formed round solids, and the conic sections or the spiric curves are generated by various sections of solids. Of these sections, the conic sections were discovered by Menaechmus, and Eratosthenes in his account says: "Cut not the cone in the triads of Menaechmus"^a; and the others were discovered by Perseus,^b who wrote an epigram on the discovery—

Three spiric lines upon five sections finding,
Perseus thanked the gods therefor.

Now the three conic sections are the parabola, the hyperbola and the ellipse, while of the spiric sections one is *interlaced*, resembling the horse-fetter, another is widened out in the middle and contracts on each side, a third is elongated and is narrower in the middle, broadening out on either side. The number of the other mixed lines is unlimited; for the number of solid figures is infinite and there are many different kinds of section of them.

Ibid., ed. Friedlein 356. 8-12

For Apollonius shows for each of the conic curves what is its property, as does Nicomedes for the

GREEK MATHEMATICS

τῶν τετραγωνιζουσῶν, καὶ ὁ Περσεὺς ἐπὶ τῶν σπειρικῶν.

Ibid., ed. Friedlein 119. 8-17

“Ὁ δὲ συμβαίνειν φάμεν κατὰ τὴν σπειρικὴν ἐπιφάνειαν· κατὰ γὰρ κύκλου νοεῖται στροφὴν ὀρθοῦ διαμένοντος καὶ στρεφομένου περὶ τὸ αὐτὸ σημεῖον, ὃ μὴ ἐστὶ κέντρον τοῦ κύκλου, διὸ καὶ τριχῶς ἡ σπείρα γίνεται, ἥ γὰρ ἐπὶ τῆς περιφερείας ἐστὶ τὸ κέντρον ἢ ἐντὸς ἢ ἐκτός. καὶ εἰ μὲν ἐπὶ τῆς περιφερείας ἐστὶ τὸ κέντρον, γίνεται σπείρα συνεχῆς, εἰ δὲ ἐντός, ἡ ἐμπεπλεγμένη, εἰ δὲ ἐκτός, ἡ διεχῆς. καὶ τρεῖς αἱ σπειρικαὶ τομαὶ κατὰ τὰς τρεῖς ταύτας διαφοράς.

* Obviously the work of Perseus was on a substantial scale to be associated with these names, but nothing is known of him beyond these two references. He presumably flourished after Euclid (since the conic sections were probably well developed before the spiric sections were tackled) and before Geminus (since Proclus relies on Geminus for his knowledge of the spiric curves). He may therefore be placed between 300 and 75 B.C.

Nicomedes appears to have flourished between Eratosthenes and Apollonius. He is known only as the inventor of the conchoid, which has already been fully described (vol. i. pp. 298-309).

It is convenient to recall here that about a century later flourished Diocles, whose discovery of the cissoid has already been sufficiently noted (vol. i. pp. 270-279). He has also been referred to as the author of a brilliant solution of the problem of dividing a cone in a given ratio, which is equivalent to the solution of a cubic equation (*supra*, p. 162 n. a). The Dionysodorus who solved the same problem (*ibid.*) may have been the Dionysodorus of Caunus mentioned in the Herculaneum Roll, No. 1044 (so W. Schmidt in *Bibliotheca mathematica*, iv. pp. 321-325), a younger contemporary of Apollonius; he is presumably the same person as the

364

LATER DEVELOPMENTS IN GEOMETRY

conchoid and Hippias for the quadratics and Perseus for the spiric curves.^a

Ibid., ed. Friedlein 119. 8-17

We say that this is the case with the spiric surface ; for it is conceived as generated by the revolution of a circle remaining perpendicular [to a given plane] and turning about a fixed point which is not its centre. Hence there are three forms of spire according as the centre is on the circumference, or within it, or without. If the centre is on the circumference, the spire generated is said to be *continuous*, if within *interlaced*, and if without *open*. And there are three spiric sections according to these three differences.^b

Dionysodorus mentioned by Heron, *Metrica* ii. 13 (cited *infra*, p. 481), as the author of a book *On the Spire*.

^b This last sentence is believed to be a slip, perhaps due to too hurried transcription from Geminus. At any rate, no satisfactory meaning can be obtained from the sentence as it stands. Tannery (*Mémoires scientifiques* ii. pp. 24-25) interprets Perseus' epigram as meaning "three curves *in addition* to five sections." He explains the passages thus: Let a be the radius of the generating circle, c the distance of the centre of the generating circle from the axis of revolution, d the perpendicular distance of the plane of section (assumed to be parallel to the axis of revolution) from the axis of revolution. Then in the *open* spire, in which $c > a$, there are five different cases:

- (1) $c + a > d > c$. The curve is an oval.
- (2) $d = c$. Transition to (3).
- (3) $c > d > c - a$. The curve is a closed curve narrowest in the middle.
- (4) $d = c - a$. The curve is the *hippopede* (horse-fetter), which is shaped like the figure of 8 (*v.* vol. i. pp. 414-415 for the use of this curve by Eudoxus).
- (5) $c - a > d > 0$. The section consists of two symmetrical ovals.

Tannery identifies the "five sections" of Perseus with these five types of section of the open spire; the three curves

(b) ATTEMPTS TO PROVE THE PARALLEL POSTULATE

(i.) General

Procl. in *Euc.* i., ed. Friedlein 191. 16-193. 9

“Καὶ ἐὰν εἰς δύο εὐθείας εὐθεία ἐμπίπτουσα τὰς ἐντὸς καὶ ἐπὶ τὰ αὐτὰ μέρη γωνίας δύο ὀρθῶν ἐλάττονας ποιῇ, ἐκβαλλομένης τὰς εὐθείας ἐπ’ ἄπειρον συμπίπτειν, ἐφ’ ἃ μέρη εἰσὶν αἱ τῶν δύο ὀρθῶν ἐλάττονες.”

Τοῦτο καὶ παντελῶς διαγράφειν χρή τῶν αἰτημάτων· θεώρημα γάρ ἐστι, πολλὰς μὲν ἀπορίας ἐπιδεχόμενον, ἃς καὶ ὁ Πτολεμαῖος ἐν τινι βιβλίῳ διαλῦσαι πρὸνθετο, πολλῶν δὲ εἰς ἀπόδειξιν δεόμενον καὶ ὄρων καὶ θεωρημάτων. καὶ τό γε ἀντιστρέφον καὶ ὁ Εὐκλείδης ὡς θεώρημα δείκνυσιν. ἴσως δὲ ἂν τινες ἀπατώμενοι καὶ τοῦτο τάττειν ἐν τοῖς αἰτήμασιν ἀξιῶσιν, ὡς διὰ τὴν ἐλάττωσιν τῶν δύο ὀρθῶν αὐτόθεν τὴν πίστιν παρεχόμενον

described by Proclus are (1), (3) and (4). When the spire is *continuous* or closed, $c=a$ and there are only three sections corresponding to (1), (2) and (3); (4) and (5) reduce to two equal circles touching one another. But the *interlaced* spire, in which $c < a$, gives three new types of section, and in these Tannery sees his “three curves in addition to five sections.” There are difficulties in the way of accepting this interpretation, but no better has been proposed.

Further passages on the spire by Heron, including a formula for its volume, are given *infra*, pp. 476-483.

^a *Euc.* i. Post. 5, for which v. vol. i. pp. 442-443, especially n. c.

Aristotle (*Anal. Prior.* ii. 16, 65 a 4) alludes to a *petitio principii* current in his day among those who “think they establish the theory of parallels”—τὰς παραλλήλους γράφειν. As Heath notes (*The Thirteen Books of Euclid's Elements*,

LATER DEVELOPMENTS IN GEOMETRY

(b) ATTEMPTS TO PROVE THE PARALLEL POSTULATE

(i.) General

Proclus, *On Euclid i.*, ed. Friedlein 191. 16-193. 9

"If a straight line falling on two straight lines make the interior angles on the same side less than two right angles, the two straight lines, if produced indefinitely, meet on that side on which are the angles less than two right angles." ^a

This ought to be struck right out of the Postulates; for it is a theorem, and one involving many difficulties, which Ptolemy set himself to resolve in one of his books, and for its proof it needs a number of definitions as well as theorems. Euclid actually proves its converse as a theorem. Possibly some would erroneously consider it right to place this assumption among the Postulates, arguing that, as the angles are less than two right angles, there is

vol. i. pp. 191-192), Philoponus's comment on this passage suggests that the *petitio principii* lay in a *direction* theory of parallels. Euclid appears to have admitted the validity of the criticism and, by *assuming* his famous postulate once and for all, to have countered any logical objections.

Nevertheless, as the extracts here given will show, ancient geometers were not prepared to accept the undemonstrable character of the postulate. Attempts to prove it continued to be made until recent times, and are summarized by F. Bonola, "Sulla teoria delle parallele e sulle geometrie non-euclidee" in *Questioni riguardanti la geometria elementare*, and by Heath, *loc. cit.*, pp. 204-219. The chapter on the subject in W. Rouse Ball's *Mathematical Essays and Recreations*, pp. 307-326, may also be read with profit. Attempts to prove the postulate were abandoned only when it was shown that, by not conceding it, alternative geometries could be built.

τῆς τῶν εὐθειῶν συνεύσεως καὶ συμπτώσεως. πρὸς οὗς ὁ Γεμίνιος ὀρθῶς ἀπήντησε λέγων ὅτι παρ' αὐτῶν ἐμάθομεν τῶν τῆς ἐπιστήμης ταύτης ἡγεμόνων μὴ πάνυ προσέχειν τὸν νοῦν ταῖς πιθαναῖς φαντασίαις εἰς τὴν τῶν λόγων τῶν ἐν γεωμετρίᾳ παραδοχὴν. ὅμοιον γάρ φησι καὶ Ἀριστοτέλης ῥητορικὸν ἀποδείξεις ἀπαιτεῖν καὶ γεωμέτρου πιθανολογοῦντος ἀνέχεσθαι, καὶ ὁ παρὰ τῷ Πλάτῳ Σιμμίας, ὅτι " τοῖς ἐκ τῶν εἰκότων τὰς ἀποδείξεις ποιουμένοις σύννοια οὖσιν ἀλαζόσι." κἀνταῦθα τοίνυν τὸ μὲν ἡλαττωμένων τῶν ὀρθῶν συνεύειν τὰς εὐθείας ἀληθές καὶ ἀναγκαῖον, τὸ δὲ συνενούσας ἐπὶ πλεον ἐν τῷ ἐκβάλλεσθαι συμπεσεῖσθαι ποτε πιθανόν, ἀλλ' οὐκ ἀναγκαῖον, εἰ μὴ τις ἀποδείξειεν λόγος, ὅτι ἐπὶ τῶν εὐθειῶν τοῦτο ἀληθές. τὸ γὰρ εἶναί τινας γραμμὰς συνιούσας μὲν ἐπ' ἄπειρον, ἀσυμπτώτους δὲ ὑπαρχούσας, καίτοι δοκοῦν ἀπίθανον εἶναι καὶ παράδοξον, ὅμως ἀληθές ἐστι καὶ πεφύραται ἐπ' ἄλλων εἰδῶν τῆς γραμμῆς. μήποτε οὖν τοῦτο καὶ ἐπὶ τῶν εὐθειῶν δυνατόν, ὅπερ ἐπ' ἐκείνων τῶν γραμμῶν; ἕως γὰρ ἂν δι' ἀποδείξεως αὐτὸ καταδησώμεθα, περισπᾷ τὴν φαντασίαν τὰ ἐπ' ἄλλων δεικνύμενα γραμμῶν. εἰ δὲ καὶ οἱ διαμφισβητοῦντες λόγοι πρὸς τὴν σύμπτωσιν πολὺ τὸ πληκτικὸν ἔχουσιν, πῶς οὐχὶ πολλῷ πλεον ἂν τὸ πιθανόν τοῦτο καὶ τὸ ἄλογον ἐκβάλλοιμεν τῆς ἡμετέρας παραδοχῆς;

Ἄλλ' ὅτι μὲν ἀπόδειξιν χρὴ ζητεῖν τοῦ προκειμένου θεωρήματος δῆλον ἐκ τούτων, καὶ ὅτι

* For Geminus, v. *infra*, p. 370 n. c.

LATER DEVELOPMENTS IN GEOMETRY

immediate reason for believing that the straight lines converge and meet. To such, Geminus ^a rightly rejoined that we have learnt from the pioneers of this science not to incline our mind to mere plausible imaginings when it is a question of the arguments to be used in geometry. For Aristotle ^b says it is as reasonable to demand scientific proof from a rhetorician as to accept mere plausibilities from a geometer, and Simmias is made to say by Plato ^c that he "recognizes as quacks those who base their proofs on probabilities." In this case the convergence of the straight lines by reason of the lessening of the right angles is true and necessary, but the statement that, since they converge more and more as they are produced, they will some time meet is plausible but not necessary, unless some argument is produced to show that this is true in the case of straight lines. For the fact that there are certain lines which converge indefinitely but remain non-secant, although it seems improbable and paradoxical, is nevertheless true and well-established in the case of other species of lines. May not this same thing be possible in the case of straight lines as happens in the case of those other lines? For until it is established by rigid proof, the facts shown in the case of other lines may turn our minds the other way. And though the controversial arguments against the meeting of the two lines should contain much that is surprising, is that not all the more reason for expelling this merely plausible and irrational assumption from our accepted teaching?

It is clear that a proof of the theorem in question must be sought, and that it is alien to the special

Ibid., ed. Friedlein 176. 5-10

Καὶ ὁ μὲν Εὐκλείδης τοῦτον ὀρίζειται τὸν τρόπον τὰς παραλλήλους εὐθείας, ὁ δὲ Ποσειδώνιος, παράλληλοι, φησὶν, εἰσὶν αἱ μήτε συνεύουσαι μήτε ἀπονεύουσαι ἐν ἐνὶ ἐπιπέδῳ, ἀλλ' ἴσας ἔχουσαι

^a i.e., Eucl. i. 28.

^b Posidonius was a Stoic and the teacher of Cicero; he was born at Apamea and taught at Rhodes, flourishing 151-135 B.C. He contributed a number of definitions to elementary geometry, as we know from Proclus, but is more famous for a geographical work *On the Ocean* (lost but copiously quoted by Strabo) and for an astronomical work *Περὶ μετεώρων*. In this he estimated the circumference of the earth (v. *supra*, p. 267) and he also wrote a separate work on the size of the sun.

^c As with so many of the great mathematicians of antiquity, we know practically nothing about Geminus's life, not even his date, birthplace or the correct spelling of his name. As he wrote a commentary on Posidonius's *Περὶ μετεώρων*, we have an upper limit for his date, and "the view most generally accepted is that he was a Stoic philosopher, born probably in the island of Rhodes, and a pupil of Posidonius, and that he wrote about 73-67 B.C." (Heath, *H.G.M.* ii. 223). Further details may be found in Manitius's edition of the so-called *Gemini elementa astronomiae*.

Geminus wrote an encyclopaedic work on mathematics

LATER DEVELOPMENTS IN GEOMETRY

character of the Postulates. But how it should be proved, and by what sort of arguments the objections made against it may be removed, must be stated at the point where the writer of the *Elements* is about to recall it and to use it as obvious.^a Then it will be necessary to prove that its obvious character does not appear independently of proof, but by proof is made a matter of knowledge.

(ii.) *Posidonius*^b and *Geminus*^c

Ibid., ed. Friedlein 176. 5-10

Such is the manner in which Euclid defines parallel straight lines, but Posidonius says that parallels are lines in one plane which neither converge nor diverge

which is referred to by ancient writers under various names, but that used by Eutocius (Τῶν μαθημάτων θεωρία, v. *supra*, pp. 280-281) was most probably the actual title. It is unfortunately no longer extant, but frequent references are made to it by Proclus, and long extracts are preserved in an Arabic commentary by an-Nairizī.

It is from this commentary that Geminus is known to have attempted to prove the parallel-postulate by a definition of parallels similar to that of Posidonius. The method is reproduced in Heath, *H.C.V.* ii. 298-330. It tacitly assumes "Playfair's axiom," that through a given point only one parallel can be drawn to a given straight line: this axiom — which was explicitly stated by Proclus in his commentary on *Eucl.* i. 30 (*Procl. in Eucl.* i., ed. Friedlein 374. 18-375. 3) — is, in fact, equivalent to Euclid's Postulate 5. Saccheri noted an even more fundamental objection, that, before Geminus's definition of parallels can be used, it has to be proved that the locus of points equidistant from a straight line is a straight line; and this cannot be done without some equivalent postulate. Nevertheless, Geminus deserves to be held in honour as the author of the first known attempt to prove the parallel-postulate, a worthy predecessor to Lobachewsky and Riemann.

† The argument would have been clearer if it had been proved that the two interior angles on one side of ZH were *severally* equal to the two interior angles on the other side, that is $BZH = \Gamma HZ$ and $\Delta HZ = AZH$; whence, if ZA, HΓ meet at Λ, the triangle ZHΛ can be rotated about the mid-

LATER DEVELOPMENTS IN GEOMETRY

secant. For, if it be possible, let BZ , $H\Delta$, when produced, meet at K . Then since the straight line HZ stands on AB , it makes the angles AZH , BZH equal to two right angles [Eucl. i. 13]. Similarly, since HZ stands on $\Gamma\Delta$, it makes the angles ΓHZ , ΔHZ equal to two right angles [*ibid.*]. Therefore the four angles AZH , BZH , ΓHZ , ΔHZ are equal to four right angles, and of them two, BZH , $ZH\Delta$, are by hypothesis equal to two right angles. Therefore the remaining angles AZH , ΓHZ are also themselves equal to two right angles. If then, the interior angles being equal to two right angles, ZB , $H\Delta$ meet at K when produced, ZA , $H\Gamma$ will also meet when produced. For the angles AZH , ΓHZ are also equal to two right angles. Therefore the straight lines will either meet on both sides or on neither, since these angles also are equal to two right angles. Let ZA , $H\Gamma$ meet, then, at Λ . Then the straight lines ΛABK , $\Lambda \Gamma \Delta K$ enclose a space, which is impossible.^a Therefore it is not possible that, if the interior angles be equal to two right angles, the straight lines should meet. Therefore they are parallel.^b

Ibid., ed. Friedlein 365. 5-367. 27

Therefore certain others already classed as a theorem this postulate assumed by the writer of the *Elements* and demanded a proof. Ptolemy appears

point of ZH so that ZH lies where HZ is in the figure, while ZK , HK lie along the sides $H\Gamma$, ZA respectively; and therefore $H\Gamma$, ZA must meet at the point where K falls.

The proof is based on the assumption that two straight lines cannot enclose a space. But Riemann devised a geometry in which this assumption does not hold good, for all straight lines having a common point have another point common also.

αὐτὸ δεικνύναι ἐν τῷ περὶ τοῦ τὰς ἀπ' ἐλαττόνων ἢ δύο ὀρθῶν ἐκβαλλομένης συμπίπτειν, καὶ δείκνυσι πολλὰ προλαβὼν τῶν μέχρι τοῦδε τοῦ θεωρήματος ὑπὸ τοῦ Στοιχειωτοῦ προαποδεδειγμένων. καὶ ὑποκείσθω πάντα εἶναι ἀληθῆ, ἵνα μὴ καὶ ἡμεῖς ὄχλον ἐπεισάγωμεν ἄλλον, καὶ ὡς λημμάτιον τοῦτο δείκνυσθαι διὰ τῶν προειρημένων· ἐν δὲ καὶ τοῦτο τῶν προδεδειγμένων τὸ τὰς ἀπὸ δυεῖν ὀρθαῖς ἴσων ἐκβαλλομένας μηδαμῶς συμπίπτειν. λέγω τοίνυν ὅτι καὶ τὸ ἀνάπαλιν ἀληθές, καὶ τὸ παραλλήλων οὐσῶν τῶν εὐθειῶν καὶ τεμνομένων ὑπὸ μιᾶς εὐθείας τὰς ἐντὸς καὶ ἐπὶ τὰ αὐτὰ μέρη γωνίας δύο ὀρθαῖς ἴσας εἶναι. ἀνάγκη γὰρ τὴν τέμνουσαν τὰς παραλλήλους ἢ δύο ὀρθαῖς ἴσας ποιεῖν τὰς ἐντὸς καὶ ἐπὶ τὰ αὐτὰ μέρη γωνίας ἢ δύο ὀρθῶν ἐλάσσους ἢ μείζους. ἔστωσαν οὖν παράλληλοι αἱ AB, ΓΔ, καὶ ἐμπίπτέτω εἰς αὐτὰς ἡ HZ; λέγω ὅτι οὐ ποιεῖ δύο ὀρθῶν μείζους τὰς ἐντὸς καὶ ἐπὶ τὰ αὐτά. εἰ γὰρ αἱ ὑπὸ AZH, ΓHZ δύο

ὀρθῶν μείζους, αἱ λοιπαὶ αἱ ὑπὸ BZH, ΔHZ δύο ὀρθῶν ἐλάσσους. ἀλλὰ καὶ δύο ὀρθῶν μείζους αἱ αὐταί· οὐδὲν γὰρ μᾶλλον αἱ AZ, ΓH παράλληλοι ἢ ZB, HΔ, ὥστε εἰ ἡ ἐμπεσοῦσα εἰς τὰς AZ, ΓH δύο ὀρθῶν μείζους ποιεῖ τὰς ἐντὸς, καὶ

LATER DEVELOPMENTS IN GEOMETRY

to have proved it in his book on the proposition that *straight lines drawn from angles less than two right angles meet if produced*, and he uses in the proof many of the propositions proved by the writer of the *Elements* before this theorem. Let all these be taken as true, in order that we may not introduce another mass of propositions, and by means of the aforesaid propositions this theorem is proved as a lemma, that *straight lines drawn from two angles together equal to two right angles do not meet when produced*^a—for this is common to both sets of preparatory theorems. I say then that the converse is also true, that *if parallel straight lines be cut by one straight line the interior angles on the same side are equal to two right angles*.^b For the straight line cutting the parallel straight lines must make the interior angles on the same side equal to two right angles or less or greater. Let $AB, \Gamma\Delta$ be parallel straight lines, and let HZ cut them; I say that it does not make the interior angles on the same side greater than two right angles. For if the angles $AZH, \Gamma HZ$ are greater than two right angles, the remaining angles $BZH, \Delta HZ$ are less than two right angles.^c But these same angles are greater than two right angles; for $AZ, \Gamma H$ are not more parallel than $ZB, H\Delta$, so that if the straight line falling on $AZ, \Gamma H$ make the interior angles greater than two right angles, the same straight line falling

^a This is equivalent to Eucl. i. 28.

^b This is equivalent to Eucl. i. 29.

^c By Eucl. i. 13, for the angles AZH, BZH are together equal to two right angles and so are the angles $\Gamma HZ, \Delta HZ$.

ἢ εἰς τὰς ΖΒ, ΗΔ ἐμπίπτουσα δύο ὀρθῶν ποιήσῃ

 πιπτέτωσαν. ἀλλ' εἰ ἀσύμπτωτοί εἰσιν, ἐφ' ἃ
 μέρη αἱ τῶν δύο ὀρθῶν ἐλάσσονες, πολλῶ μάλλον
 ἔσονται ἀσύμπτωτοι ἐπὶ θάτερα, ἐφ' ἃ τῶν δύο
 εἰσὶν ὀρθῶν αἱ μείζονες, ὥστε ἐφ' ἑκάτερα ἂν εἴη
 ἀσύμπτωτοι αἱ εὐθεῖαι. εἰ δὲ τοῦτο, παράλληλοι
 εἰσιν. ἀλλὰ δέδεικται ὅτι ἢ εἰς τὰς παραλλήλους
 ἐμπίπτουσα τὰς ἐντός καὶ ἐπὶ τὰ αὐτὰ μέρη δύο
 ὀρθαῖς ἴσας ποιήσῃ γωνίας. αἱ αὐταὶ ἄρα καὶ δύο
 ὀρθαῖς ἴσαι καὶ δύο ὀρθῶν ἐλάσσονες, ὅπερ
 ἀδύνατον.

Ταῦτα προδεδειχὼς ὁ Πτολεμαῖος καὶ καταν

" See note c on p. 377.

^b The fallacy lies in the assumption that "AZ, HI are no more parallel than ZB, HD," so that the angles BZI, DHI must also be greater than two right angles. This assumption

LATER DEVELOPMENTS IN GEOMETRY

on ZB , $H\Delta$ also makes the interior angles greater than two right angles ; but these same angles are less than two right angles, for the four angles AZH , ΓHZ , BZH , ΔHZ are equal to four right angles ^a ; which is impossible. Similarly we may prove that a straight line falling on parallel straight lines does not make the interior angles on the same side less than two right angles. But if it make them neither greater nor less than two right angles, the only conclusion left is that the transversal makes the interior angles on the same side equal to two right angles.^b

With this preliminary proof, the theorem in question is proved beyond dispute. I mean that *if a straight line falling on two straight lines make the interior angles on the same side less than two right angles, the two straight lines, if produced, will meet on that side on which are the angles less than two right angles*. For [, if possible,] let them not meet. But if they are non-secant on the side on which are the angles less than two right angles, by much more will they be non-secant on the other side, on which are the angles greater than two right angles, so that the straight lines would be non-secant on both sides. Now if this should be so, they are parallel. But it has been proved that a straight line falling on parallel straight lines makes the interior angles on the same side equal to two right angles. Therefore the same angles are both equal to and less than two right angles, which is impossible.

Having first proved these things and squarely faced tion is equivalent to the hypothesis that through a given point only one parallel can be drawn to a given straight line ; but this hypothesis can be proved equivalent to Euclid's postulate. It is known as "Playfair's Axiom," but is, in fact, stated by Proclus in his note on Eucl. i. 31.

LATER DEVELOPMENTS IN GEOMETRY

the theorem in question, Ptolemy tries to make a more precise addition and to prove that, if a straight line falling on two straight lines make the interior angles on the same side less than two right angles, not only are the straight lines not non-secant, as has been proved, but their meeting takes place on that side on which the angles are less than two right angles, and not on the side on which they are greater. For let AB , $\Gamma\Delta$ be two straight lines and let $EZH\Theta$ fall on them and make the angles AZH , ΓHZ less than two right angles. Then the remaining angles are greater than two right angles [Eucl. i. 13]. Now it has been proved that the straight lines are not non-secant. If they meet, they will meet either on the side of A , Γ or on the side of B , Δ . Let them meet on the side of B , Δ at K . Then since the angles AZH , ΓHZ are less than two right angles, while the angles AZH , BZH are equal to two right angles, when the common angle AZH is taken away, the angle ΓHZ will be less

¹ $\sigma\beta$ is clearly out of place.

than the angle BZH. Therefore the exterior angle of the triangle KZH will be less than the interior and opposite angle, which is impossible [Eucl. i. 16]. Therefore they will not meet on this side. But they do meet. Therefore their meeting will be on the other side, on which the angles are less than two right angles.

•

(iv.) *Proclus*

Ibid., ed. Friedlein 371. 23-373. 2

This having first been assumed, I say that, *if any straight line cut one of parallel straight lines, it will cut the other also.*

For let AB, $\Gamma\Delta$ be parallel straight lines, and let EZH cut AB. I say that it will cut $\Gamma\Delta$.

For since BZ, ZH are two straight lines drawn from one point Z, they have, when produced indefinitely, a distance greater than any magnitude, so that it will also be greater than that between the parallels.

ὅταν οὖν μείζον ἀλλήλων διαστῶσιν τῆς τούτων διαστάσεως τεμεῖ ἢ ZH τὴν $\Gamma\Delta$. ἐὰν ἄρα παραλλήλων τὴν ἑτέραν τέμνη τις εὐθεῖα, τεμεῖ καὶ τὴν λοιπὴν.

Τούτου προαποδείχθεντος ἀκολουθῶς δείξομεν τὸ προκείμενον. ἔστωσαν γὰρ δύο εὐθεῖαι αἱ AB , $\Gamma\Delta$, καὶ ἐμπιπτέτω εἰς αὐτὰς ἡ EZ ἐλάσσονας δύο ὀρθῶν ποιούσα τὰς ὑπὸ BEZ , ΔZE .¹ λέγω ὅτι συμπεσοῦνται αἱ εὐθεῖαι κατὰ ταῦτα τὰ μέρη, ἐφ' ᾧ αἱ τῶν δύο ὀρθῶν εἰσιν ἐλάσσους.

Ἐπειδὴ γὰρ αἱ ὑπὸ BEZ , ΔZE ἐλάσσους εἰσὶν δύο ὀρθῶν, τῇ ὑπεροχῇ τῶν δύο ὀρθῶν ἔστω ἴση ἡ ὑπὸ ΘEB . καὶ ἐκβεβλήσθω ἡ ΘE ἐπὶ τὸ K . ἐπεὶ οὖν εἰς τὰς $K\Theta$, $\Gamma\Delta$ ἐμπέπτωκεν ἡ EZ καὶ ποιεῖ τὰς ἐντὸς δύο ὀρθαῖς ἴσας τὰς ὑπὸ ΘEZ , ΔZE , παράλληλοί εἰσιν αἱ ΘK , $\Gamma\Delta$ εὐθεῖαι. καὶ τέμνει τὴν $K\Theta$ ἡ AB . τεμεῖ ἄρα καὶ τὴν $\Gamma\Delta$ διὰ τὸ προδεδειγμένον. συμπεσοῦνται ἄρα αἱ AB , $\Gamma\Delta$ κατὰ τὰ μέρη ἐκεῖνα, ἐφ' ᾧ αἱ τῶν δύο ὀρθῶν ἐλάσσονες, ὥστε δέδεικται τὸ προκείμενον.

¹ ΔEZ codd., correxi.

* The method is ingenious, but Clavius detected the flaw, which lies in the initial assumption, taken from Aristotle, that two divergent straight lines will eventually be so far apart that a perpendicular drawn from a point on one to the other will be greater than any assigned distance; Clavius draws attention to the conchoid of Nicomedes (v. vol. i. pp. 298-301), which continually approaches its asymptote, and therefore continually gets farther away from the tangent at the vertex; but the perpendicular from any point on the curve to that tangent will always be less than the distance between the tangent and the asymptote.

LATER DEVELOPMENTS IN GEOMETRY

Whenever, therefore, they are at a distance from one another greater than the distance between the parallels, ZH will cut $\Gamma\Delta$. If, therefore, any straight line cuts one of parallels, it will cut the other also.

This having first been established, we shall prove in turn the theorem in question. For let $AB, \Gamma\Delta$ be two straight lines, and let EZ fall on them so as to

make the angles $BEZ, \Delta ZE$ less than two right angles. I say that the straight lines will meet on that side on which are the angles less than two right angles.

For since the angles $BEZ, \Delta ZE$ are less than two right angles, let the angle ΘEB be equal to the excess of the two right angles. And let ΘE be produced to K . Then since EZ falls on $K\Theta, \Gamma\Delta$ and makes the interior angles $\Theta EZ, \Delta ZE$ equal to two right angles, the straight lines $\Theta K, \Gamma\Delta$ are parallel. And AB cuts $K\Theta$; therefore, by what was before shown, it will also cut $\Gamma\Delta$. Therefore $AB, \Gamma\Delta$ will meet on that side on which are the angles less than two right angles, so that the theorem in question is proved.^a

^a ΘZ is not, in fact, joined in the ms. figures.

^b This is proved in a lemma immediately following the proposition by drawing an arc of a circle with Θ as centre

LATER DEVELOPMENTS IN GEOMETRY

I mean equilateral and equiangular figures—the greatest is that which has most angles.

For let $AB\Gamma$, ΔEZ be equilateral and equiangular figures having equal perimeters, and let $AB\Gamma$ have the more angles. I say that $AB\Gamma$ is the greater.

For let H , Θ be the centres of the circles circumscribed about the polygons $AB\Gamma$, ΔEZ , and let HB , $H\Gamma$, ΘE , ΘZ ^a be joined. And from H , Θ let HK , $\Theta\Lambda$ be drawn perpendicular to $B\Gamma$, EZ . Then since $AB\Gamma$ has more angles than ΔEZ , $B\Gamma$ is contained more often in the perimeter of $AB\Gamma$ than EZ is contained in the perimeter of ΔEZ . And the perimeters are equal. Therefore $EZ > B\Gamma$; and therefore $E\Lambda > BK$. Let ΛM be placed equal to BK , and let ΘM be joined. Then since the straight line EZ bears to the perimeter of the polygon ΔEZ the same ratio as the angle $E\Theta Z$ bears to four right angles—owing to the fact that the polygon is equilateral and the sides cut off equal arcs from the circumscribing circle, while the angles at the centre are in the same ratio as the arcs on which they stand [Eucl. iii. 26]—and the perimeter of ΔEZ , that is the perimeter of $AB\Gamma$, bears to $B\Gamma$ the same ratio as four right angles bears to the angle $BH\Gamma$, therefore *ex aequali* [Eucl. v. 17]

$$EZ : B\Gamma = \text{angle } E\Theta Z : \text{angle } BH\Gamma,$$

$$\text{i.e.,} \quad E\Lambda : \Lambda M = \text{angle } E\Theta Z : \text{angle } BH\Gamma,$$

$$\text{i.e.,} \quad E\Lambda : \Lambda M = \text{angle } E\Theta\Lambda : \text{angle } BHK.$$

And since $E\Lambda : \Lambda M > \text{angle } E\Theta\Lambda : \text{angle } M\Theta\Lambda$,
as we shall prove in due course,^b

and ΘM as radius cutting ΘE and $\Theta\Lambda$ produced, as in Eucl. *Optic.* 8 (v. vol. i. pp. 502-505); the proposition is equivalent to the formula $\tan \alpha : \tan \beta > \alpha : \beta$ if $\frac{1}{2}\pi > \alpha > \beta$.

πρὸς ΛM ἢ ὑπὸ $\text{E}\Theta\Lambda$ πρὸς τὴν ὑπὸ BHK , ἢ ὑπὸ $\text{E}\Theta\Lambda$ πρὸς τὴν ὑπὸ BHK μείζονα λόγον ἔχει ἢ πρὸς τὴν ὑπὸ $\text{M}\Theta\Lambda$. μείζων ἄρα ἢ ὑπὸ $\text{M}\Theta\Lambda$ γωνία τῆς ὑπὸ BHK . ἔστιν δὲ καὶ ὀρθὴ ἢ πρὸς τῷ Λ ὀρθῇ τῇ πρὸς τῷ K ἴση. λοιπὴ ἄρα ἢ ὑπὸ HBK μείζων ἔσται τῆς ὑπὸ $\Theta\text{M}\Lambda$. κείσθω τῇ ὑπὸ HBK ἴση ἢ ὑπὸ ΛMN καὶ διήχθω ἢ $\Lambda\Theta$ ἐπὶ τὸ N . καὶ ἐπεὶ ἴση ἐστὶν ἢ ὑπὸ HBK τῇ ὑπὸ NML , ἀλλὰ καὶ ἢ πρὸς τῷ Λ ἴση τῇ πρὸς τῷ K , ἔστι δὲ καὶ ἢ BK πλευρὰ τῇ ML ἴση, ἴση ἄρα καὶ ἢ HK τῇ NL . μείζων ἄρα ἢ HK τῆς $\Theta\Lambda$ μείζον ἄρα καὶ τὸ ὑπὸ τῆς $\text{AB}\Gamma$ περιμέτρου καὶ τῆς HK τοῦ ὑπὸ τῆς $\Delta\text{E}\text{Z}$ περιμέτρου καὶ τῆς $\Theta\Lambda$. καὶ ἔστιν τὸ μὲν ὑπὸ τῆς $\text{AB}\Gamma$ περιμέτρου καὶ τῆς HK διπλάσιον τοῦ $\text{AB}\Gamma$ πολυγώνου, ἐπεὶ καὶ τὸ ὑπὸ τῆς $\text{B}\Gamma$ καὶ τῆς HK διπλάσιόν ἐστι τοῦ $\text{HB}\Gamma$ τριγώνου. τὸ δὲ ὑπὸ τῆς $\Delta\text{E}\text{Z}$ περιμέτρου καὶ τῆς $\Theta\Lambda$ διπλάσιον τοῦ $\Delta\text{E}\text{Z}$ πολυγώνου μείζον ἄρα τὸ $\text{AB}\Gamma$ πολύγωνον τοῦ $\Delta\text{E}\text{Z}$.

Ibid. 358. 12–360. 3

Τούτου δεδειγμένου λέγω, ὅτι ἐὰν κύκλος εὐθυγράμμῳ ἰσοπλεύρῳ τε καὶ ἰσογωνίῳ ἰσοπερίμετρος ᾖ, μείζων ἔσται ὁ κύκλος.

Κύκλος γὰρ ὁ $\text{AB}\Gamma$ ἰσοπλεύρῳ τε καὶ ἰσογωνίῳ τῷ $\Delta\text{E}\text{Z}$ εὐθυγράμμῳ ἰσοπερίμετρος ἔστω· λέγω, ὅτι μείζων ἐστὶν ὁ κύκλος.

LATER DEVELOPMENTS IN GEOMETRY

and $EA : AM = \text{angle } E\theta A : \text{angle } BHK$,
 $\therefore \text{angle } E\theta A : \text{angle } BHK > \text{angle } E\theta A : M\theta A$.
 $\therefore \text{angle } M\theta A > \text{angle } BHK$.

Now the right angle at A is equal to the right angle at K . Therefore the remaining angle HBK is greater than the angle θMA [by Eucl. i. 32]. Let the angle AMN be placed equal to the angle HBK , and let $A\theta$ be produced to N . Then since the angle HBK is equal to the angle NMA , and the angle at A is equal to the angle at K , while BK is equal to the side MA , therefore HK is equal to NA [Eucl. i. 26]. Therefore $HK > \theta A$. Therefore the rectangle contained by the perimeter of $AB\Gamma$ and HK is greater than the rectangle contained by the perimeter of ΔEZ and θA . But the rectangle contained by the perimeter of $AB\Gamma$ and HK is double of the polygon $AB\Gamma$, since the rectangle contained by $B\Gamma$ and HK is double of the triangle $HB\Gamma$ [Eucl. i. 41]; and the rectangle contained by the perimeter of ΔEZ and θA is double of the polygon ΔEZ . Therefore the polygon $AB\Gamma$ is greater than ΔEZ .

Ibid. 358. 12-360. 3

This having been proved, I say that *if a circle have an equal perimeter with an equilateral and equiangular rectilineal figure, the circle shall be the greater.*

For let $AB\Gamma$ be a circle having an equal perimeter with the equilateral and equiangular rectilineal figure ΔEZ . I say that the circle is the greater.

Let H be the centre of the circle $AB\Gamma$, θ the centre of the circle circumscribing the polygon ΔEZ ; and let there be circumscribed about the circle $AB\Gamma$ the

Τοιούτων δὲ τῶν περὶ τὴν ἔκλειψιν τῆς σελήνης εἶναι ἐπιδεδειγμένων δοκεῖ ἐναντιοῦσθαι τῷ λόγῳ τῷ κατασκευάζοντι ἐκλείπειν τὴν σελήνην εἰς τὴν σκιὰν ἐμπίπτουσαν τῆς γῆς τὰ λεγόμενα κατὰ τὰς παραδόξους τῶν ἐκλείψεων. φασὶ γάρ τινες, ὅτι γίνεται σελήνης ἔκλειψις καὶ ἀμφοτέρων τῶν φωτῶν ὑπὲρ τὸν ὀρίζοντα θεωρουμένων. τοῦτον δὲ δῆλον ποιεῖ, διότι μὴ ἐκλείπει ἡ σελήνη τῇ σκιᾷ

* Hypsicles, who flourished in the second half of the second century B.C., is the author of the continuation of Euclid's *Elements* known as Book xiv. Diophantus attributed to him a definition of a polygonal number which is equivalent to the formula $\frac{1}{2} n \{2 + (n - 1)(a - 2)\}$ for the n th a -gonal number.

The passage here cited is the earliest known reference in Greek to the division of the ecliptic into 360 degrees. This number appears to have been adopted by the Greeks from the Chaldeans, among whom the zodiac was divided into twelve signs and each sign into thirty parts according to one system, sixty according to another (v. Tannery, *Mémoires scientifiques*, ii. pp. 256-268). The Chaldeans do not, however, seem to have applied this system to other circles; Hipparchus is believed to have been the first to divide the

LATER DEVELOPMENTS IN GEOMETRY

divided into 360 equal arcs, let each of the arcs be called a *degree in space*, and similarly, if the time in which the zodiac circle returns to any position it has left be divided into 360 equal times, let each of the times be called a *degree in time*.^a

(e) HANDBOOKS

(i.) *Cleomedes*^b

Cleomedes, *On the Circular Motion of the Heavenly Bodies* ii. 6, ed. Ziegler 218. 8-224. 8

Although these facts have been proved with regard to the eclipse of the moon, the argument that the moon suffers eclipse by falling into the shadow of the earth seems to be refuted by the stories told about paradoxical eclipses. For some say that an eclipse of the moon may take place even when both luminaries are seen above the horizon. This should make it clear that the moon does not suffer eclipse by

circle in general into 360 degrees. The problem which Hypsicles sets himself in his book is: *Given the ratio between the length of the longest day and the length of the shortest day at any given place, to find how many time-degrees it takes any given sign to rise.* A number of arithmetical lemmas are proved.

^b Cleomedes is known only as the author of the two books *Κυκλική θεωρία μετεώρων*. This work is almost wholly based on Posidonius. He must therefore have lived after Posidonius and presumably before Ptolemy, as he appears to know nothing of Ptolemy's works. In default of better evidence, he is generally assigned to the middle of the first century B.C.

The passage explaining the measurement of the earth by Eratosthenes has already been cited (*supra*, pp. 266-273). This is the only other passage calling for notice.

τῆς γῆς περιπίπτουσα, ἀλλ' ἕτερον τρόπον. . . . οἱ παλαιότεροι τῶν μαθηματικῶν οὕτως ἐπεχείρουν λύειν τὴν ἀπορίαν ταύτην. ἔφασαν γάρ, ὅτι . . . οἱ δ' ἐπὶ γῆς ἐστῶτες οὐδὲν ἂν κωλύοιντο ὁρᾶν ἀμφοτέρους αὐτοὺς ἐπὶ τοῖς κυρτώμασι τῆς γῆς ἐστῶτες. . . . τοιαύτην μὲν οὖν οἱ παλαιότεροι τῶν μαθηματικῶν τὴν τῆς προσαγομένης ἀπορίας λύσιν ἐποιήσαντο. μή ποτε δ' οὐχ ὑγιῶς εἰσιν ἐννηεγμένοι. ἐφ' ὕψους μὲν γὰρ ἡ ὄψις ἡμῶν γενομένη δύναται ἂν τοῦτο παθεῖν, κωνοειδοὺς τοῦ ὀρίζοντος γινομένου πολὺ ἀπὸ τῆς γῆς ἐκ τὸν ἀέρα ἡμῶν ἐξαρθέντων, ἐπὶ ἰδὲ τῆς γῆς ἐστῶτων οὐδαμῶς. εἰ γὰρ καὶ κύρτωμά ἐστιν, ἐφ' οὗ βεβήκαμεν, ἀφανίζεται ἡμῶν ἡ ὄψις ὑπὸ τοῦ μεγέθους τῆς γῆς. . . . ἀλλὰ πρῶτον μὲν ἀπαντητέον λέγοντας, ὅτι πέπλασται ὁ λόγος οὗτος ὑπὸ τινων ἀπορίαν βουλομένων ἐμποιεῖσαι τοῖς περὶ ταῦτα καταγινομένοις τῶν ἀστρολόγων καὶ φιλοσόφων. . . . πολλῶν δὲ καὶ παντοδαπῶν περὶ τὸν ἀέρα παθῶν συνίστασθαι πεφυκότων οὐκ ἂν εἴη ἀδύνατον, ἥδη καταδεδυκότος τοῦ ἡλίου καὶ ὑπὸ τὸν ὀρίζοντα ὄντος φαντασίαν ἡμῶν προσπεσεῖν ὥς μηδέπω καταδεδυκότος αὐτοῦ, ἡ νέφους παχύτερου πρὸς τῇ δύσει ὄντος καὶ λαμπρυνομένου ὑπὸ τῶν ἡλιακῶν ἀκτίνων καὶ ἡλίου ἡμῶν φαντασίαν ἀποπέμποντος ἡ ἀνθηλίου γενομένου. καὶ γὰρ

^a i.e., the horizon would form the base of a cone whose vertex would be at the eye of the observer. He could thus look down on both the sun and moon as along the generators of a cone, even though they were diametrically opposite each other.

LATER DEVELOPMENTS IN GEOMETRY

falling into the shadow of the earth, but in some other way. . . . The more ancient of the mathematicians tried to explain this difficulty after this fashion. They said that persons standing on the earth would not be prevented from seeing them both because they would be standing on the convexities of the earth. . . . Such is the solution of the alleged difficulty given by the more ancient of the mathematicians. But its soundness may be doubted. For, if our eye were situated on a height, the phenomenon in question might take place, the horizon becoming conical^a if we were raised sufficiently far above the earth, but it could in no wise happen if we stood on the earth. For though there might be some convexity where we stood, our sight itself becomes evanescent owing to the size of the earth. . . . The fundamental objection must first be made, that this story has been invented by certain persons wishing to make difficulty for the astronomers and philosophers who busy themselves with such matters. . . . Nevertheless, as the conditions which naturally arise in the air are many and various, it would not be impossible that, when the sun has just set and is below the horizon, we should receive the impression of its not having yet set, if there were a cloud of considerable density at the place of setting and if it were illumined by the solar rays and transmitted to us an image of the sun, or if there were a mock sun.^b For such images are often

^b Lit. "anthelion," defined in the Oxford English Dictionary as "a luminous ring or nimbus seen (chiefly in alpine or polar regions) surrounding the shadow of the observer's head projected on a cloud or fog bank opposite the sun." The explanation here tentatively put forward by Cleomedes is, of course, the true one.

(ii.) *Theon of Smyrna*

Ptolemy, *Syntaxis* x. 1, ed. Heiberg i. pars ii. 296. 14-16

For in the account given to us by Theon the mathematician we find recorded an observation made in the sixteenth year of Hadrian.^a

Theon of Smyrna, ed. Hiller 1. 1-2. 2

Everyone would agree that he could not understand the mathematical arguments used by Plato unless he were practised in this science; and that the study of these matters is neither unintelligent nor unprofitable in other respects Plato himself would seem to make plain in many ways. One who had become skilled in all geometry and all music and astronomy would be reckoned most happy on making acquaintance with the writings of Plato, but this cannot be come by easily or readily, for it calls for a very great deal of application from youth upwards. In order that those who have failed to become practised in these studies, but aim at a knowledge of his writings, should not wholly fail in their desires, I shall make a summary and concise sketch of the mathematical theorems which are specially necessary for readers of Plato, covering not only arithmetic and music and geometry, but also their application to stereometry and astronomy, for

^a *i.e.*, in A.D. 132. Ptolemy mentions other observations made by Theon in the years A.D. 127, 129, and 130. In three places Theon of Alexandria refers to his namesake as "the old Theon," ὁ Θεων παλαιός (ed. Basil. pp. 390, 395, 396).

^a The beginnings of Greek trigonometry may be found in the science of *sphaeric*, the geometry of the sphere, for which v. vol. i. p. 5 n. b. It reached its culminating point in the *Sphaerica* of Theodosius.

Trigonometry in the strict sense was founded, so far as we know, by Hipparchus, the great astronomer, who was born at Nicaea in Bithynia and is recorded by Ptolemy to have made observations between 161 and 126 B.C., the most important of them at Rhodes. His greatest achievement was the discovery of the precession of the equinoxes, and he made a calculation of the mean lunar month which differs by less than a second from the present accepted figure. Unfortunately the only work of his which has survived is his early *Commentary on the Phenomena of Eudoxus and Aratus*. It

2. PTOLEMY

(a) GENERAL

Suidas, s.v. Πτολεμαῖος

Πτολεμαῖος, ὁ Κλαύδιος χρηματίσας, Ἀλεξ-
ανδρεὺς, φιλόσοφος, γεγρονὼς ἐπὶ τῶν χρόνων
Μάρκου τοῦ βασιλέως. οὗτος ἔγραψε Μηχανικὰ
βιβλία γ, Περὶ φάσεων καὶ ἐπισημασιῶν ἀστέρων
ἀπλανῶν βιβλία β, Ἀπλωσιν ἐπιφανείας σφαίρας,
Κανόνα πρόχειρον, τὸν Μέγαν ἀστρονόμον ἥτοι
Σύνταξιν καὶ ἄλλα.

* A similar passage (i. 24, ed. H. Schöne 62. 11-20) asserts that the ratio of the side of a regular hendecagon to the diameter of the circumscribing circle is approximately $\frac{7}{25}$; and of this assertion also it is said δέδεικται δὲ ἐν τοῖς περὶ τῶν ἐν κύκλῳ εὐθειῶν. These are presumably the works of Hipparchus and Menelaus, though this opinion is controverted by A. Rome, "Premiers essais de trigonométrie rectiligne chez les Grecs" in *L'Antiquité classique*, t. 2 (1933), pp. 177-192. The assertions are equivalent to saying that $\sin 20^\circ$ is approximately 0.333... and $\sin 16^\circ 21' 49''$ is approximately 0.28.

Nothing else is certainly known of the life of Ptolemy except, as can be gleaned from his own works, that he made observations between A.D. 125 and 141 (or perhaps 151). Arabian traditions add details on which too much reliance should not be placed. Suidas's statement that he was born 408

.TRIGONOMETRY

duced to M, and let MZ be joined. Then the triangle EZM is given in the enneagon. But it has been proved in the works on chords in a circle that ZE : EM is approximately $\frac{1}{2}$.^a

2. PTOLEMY

(a) GENERAL

Suidas, s.v. *Ptolemaeus*

Ptolemy, called Claudius, an Alexandrian, a philosopher, born in the time of the Emperor Marcus. He wrote *Mechanics*, three books, *On the Phases and Seasons of the Fixed Stars*, two books, *Explanation of the Surface of a Sphere*, *A Ready Reckoner*, the *Great Astronomy* or *Syntaxis*; and others.^b

in the time of the Emperor Marcus [Aurelius] is not accurate as Marcus reigned from A.D. 161 to 180.

Ptolemy's *Mechanics* has not survived in any form; but the books *On Balancings* and *On the Elements* mentioned by Simplicius may have been contained in it. The lesser astronomical works of Ptolemy published in the second volume of Heiberg's edition of Ptolemy include, in Greek, *Φάσεις ἀπλανῶν ἀστέρων καὶ συναγωγή ἐπισημασιῶν* and *Προχείρων κανόνων διάταξις καὶ ψηφοφορία*, which can be identified with two titles in Suidas's notice. In the same edition is the *Planisphaerium*, a Latin translation from the Arabic, which can be identified with the *Ἀπλωσις ἐπιφανείας σφαίρας* of Suidas; it is an explanation of the *stereographic* system of projection by which points on the heavenly sphere are represented on the equatorial plane by projection from a pole—circles are projected into circles, as Ptolemy notes, except great circles through the poles, which are projected into straight lines.

Allied to this, but not mentioned by Suidas, is Ptolemy's *Analemma*, which explains how points on the heavenly sphere can be represented as points on a plane by means of *orthogonal* projection upon three planes mutually at right angles—

Πτολεμαῖος ἐν τῷ Περὶ τῶν στοιχείων βιβλίῳ καὶ ἐν τοῖς Ὀπτικοῖς . . .

Ibid. i. 1, 268 a 6, ed. Heiberg 9. 21-27

Ὁ δὲ θαυμαστὸς Πτολεμαῖος ἐν τῷ Περὶ διαστάσεως μονοβιβλῳ ἀπέδειξεν, ὅτι οὐκ εἰσὶ

the meridian, the horizontal and the "prime vertical." Only fragments of the Greek and a Latin version from the Arabic have survived; they are given in Heiberg's second volume.

Among the "other works" mentioned by Suidas are presumably the *Inscription in Canopus* (a record of some of Ptolemy's discoveries), which exists in Greek; the *ὑποθέσεις τῶν πλανωμένων*, of which the first book is extant in Greek and the second in Arabic; and the *Optics* and the book *On Dimension* mentioned by Simplicius.

But Ptolemy's fame rests most securely on his *Great Astronomy* or *Syntaxis* as it is called by Suidas. Ptolemy himself called this majestic astronomical work in thirteen books the *Μαθηματικὴ σύνταξις* or *Mathematical Collection*. In due course the lesser astronomical works came to be called the *Μικρὸς ἀστρονομούμενος* (τόπος), the *Little Astronomy*, and the *Syntaxis* came to be called the *Μεγάλῃ σύνταξις*, or *Great Collection*. Later still the Arabs, combining their article *Al*

TRIGONOMETRY

Simplicius, *Commentary on Aristotle's De caelo* iv. 4
(311 b 1), ed. Heiberg 710. 14-19

Ptolemy the mathematician in his work *On Balancing* maintains an opinion contrary to that of Aristotle and tries to show that in its own place neither water nor air has weight. And he proves that water has not weight from the fact that divers do not feel the weight of the water above them, even though some of them dive into considerable depths.

Ibid. i. 2, 269 a 9, ed. Heiberg 20. 11

Ptolemy in his book *On the Elements* and in his *Optics* . . .^a

Ibid. i. 1, 268 a 6, ed. Heiberg 9. 21-27

The gifted Ptolemy in his book *On Dimension* showed that there are not more than three dimen-

with the Greek superlative μέγιστος, called it Al-majisti; corrupted into *Almagest*, this has since been the favourite name for the work.

The *Syntaxis* was the subject of commentaries by Pappus and Theon of Alexandria. The trigonometry in it appears to have been abstracted from earlier treatises, but condensed and arranged more systematically.

Ptolemy's attempt to prove the parallel-postulate has already been noticed (*supra*, pp. 372-383).

^a Ptolemy's *Optics* exists in an Arabic version, which was translated into Latin in the twelfth century by Admiral Eugenius Siculus (v. G. Govi, *L'ottica di Claudio Tolomeo di Eugenio Ammiraglio di Sicilia*); but of the five books the first and the end of the last are missing. Until the Arabic text was discovered, Ptolemy's *Optics* was commonly supposed to be identical with the Latin work known as *De Speculis*; but this is now thought to be a translation of Heron's *Catoptrica* by William of Moerbeke (v. *infra*, p. 502 n. a).

πλείονες τῶν τριῶν διαστάσεις, ἐκ τοῦ δεῖν μὲν τὰς διαστάσεις ὠρισμένας εἶναι, τὰς δὲ ὠρισμένας διαστάσεις κατ' εὐθείας λαμβάνεσθαι καθέτους, τρεῖς δὲ μόνas πρὸς ὀρθὰς ἀλλήλαις εὐθείας δυνατόν εἶναι λαβεῖν, δύο μὲν καθ' ὥς τὸ ἐπίπεδον ὀρίζεται, τρίτην δὲ τὴν τὸ βάθος μετροῦσαν· ὥστε, εἴ τις εἴη μετὰ τὴν τριχῇ διάστασιν ἄλλη, ἄμετρος ἂν εἴη παντελῶς καὶ ἀόριστος.

(i.) *Introduction*

Ptolemy, *Syntaxis* i. 10, ed. Heiberg i. pars i. 31. 7-32. 9

10. On the lengths of the chords in a circle

With a view to obtaining a table ready for immediate use, we shall next set out the lengths of these [chords in a circle], dividing the perimeter into 360 segments and by the side of the arcs placing the chords subtending them for every increase of half a degree, that is, stating how many parts they are of the diameter, which it is convenient for the numerical calculations to divide into 120 segments. But first we shall show how to establish a systematic and rapid method of calculating the lengths of the chords by means of the uniform use of the smallest possible number of propositions, so that we may not only have the sizes of the chords set out correctly, but may obtain a convenient proof of the method of calculating them based on geometrical considera-

μέντοι χρῆσόμεθα ταῖς τῶν ἀριθμῶν ἐφόδοις κατὰ τὸν τῆς ἐξηκοντάδος τρόπον διὰ τὸ δύσχρηστον τῶν μοριασμῶν ἔτι τε τοῖς πολυπλασιασμοῖς καὶ μερισμοῖς ἀκολουθήσομεν τοῦ συνεγγίζοντος αἰ καταστοχαζόμενοι, καὶ καθ' ὅσον ἂν τὸ παραλειπόμενον μηδενὶ ἀξιολόγῳ διαφέρῃ τοῦ πρὸς αἴσθησιν ἀκριβοῦς.

(ii.) $\sin 18^\circ$ and $\sin 36^\circ$

Ibid. 32. 10-35. 16

*Ἐστω δὴ πρῶτον ἡμικύκλιον τὸ ΑΒΓ ἐπὶ διαμέτρου τῆς ΑΔΓ περὶ κέντρον τὸ Δ, καὶ ἀπὸ τοῦ Δ τῇ ΑΓ πρὸς ὀρθὰς γωνίας ἤχθω ἡ ΔΒ, καὶ τετμήσθω δίχα ἡ ΔΓ κατὰ τὸ Ε, καὶ ἐπεζεύχθω ἡ ΕΒ, καὶ κείσθω αὐτῇ ἴση ἡ ΕΖ, καὶ ἐπεζεύχθω ἡ ΖΒ. λέγω, ὅτι ἡ μὲν ΖΔ δεκαγώνου ἐστὶν πλευρά, ἡ δὲ ΒΖ πενταγώνου.

^a By διὰ τῆς ἐκ τῶν γραμμῶν μεθοδικῆς συστάσεως Ptolemy meant more than a graphical method; the phrase indicates a *rigorous proof* by means of geometrical considerations, as will be seen when the argument proceeds; cf. the use of διὰ τῶν γραμμῶν *infra*, p. 434. It may be inferred, therefore, that when Hipparchus proved "by means of lines" (διὰ τῶν γραμμῶν, *in the Introduction of Euclid and Aratus*, ed. Manitius 148-150) certain facts about the risings of stars, he used rigorous, and not merely graphical calculations; in other words, he was familiar with the main formulae of spherical trigonometry.

^b *i.e.*, ΖΔ is equal to the side of a regular decagon, and ΒΖ to the side of a regular pentagon, inscribed in the circle ΑΒΓ.

.TRIGONOMETRY

tions.^a In general we shall use the sexagesimal system for the numerical calculations owing to the inconvenience of having fractional parts, especially in multiplications and divisions, and we shall aim at a continually closer approximation, in such a manner that the difference from the correct figure shall be inappreciable and imperceptible.

(ii.) $\sin 18^\circ$ and $\sin 36^\circ$

Ibid. 32. 10-35. 16

First, let $AB\Gamma$ be a semicircle on the diameter $A\Delta\Gamma$ and with centre Δ , and from Δ let ΔB be drawn per-

pendicular to $A\Gamma$, and let $\Delta\Gamma$ be bisected at E , and let EB be joined, and let EZ be placed equal to it, and let ZB be joined. I say that $Z\Delta$ is the side of a decagon, and BZ of a pentagon.^b

Ἐπεὶ γὰρ εὐθεία γραμμὴ ἡ ΔΙ' τέτμηται δίχα κατὰ τὸ Ε, καὶ πρόσκειται τις αὐτῇ εὐθεία ἡ ΔΖ, τὸ ὑπὸ τῶν ΓΖ καὶ ΖΔ περιεχόμενον ὀρθογώνιον μετὰ τοῦ ἀπὸ τῆς ΕΔ τετραγώνου ἴσον ἐστὶν τῷ ἀπὸ τῆς ΕΖ τετραγώνῳ, τουτέστιν τῷ ἀπὸ τῆς ΒΕ, ἐπεὶ ἴση ἐστὶν ἡ ΕΒ τῇ ΖΕ. ἀλλὰ τῷ ἀπὸ τῆς ΕΒ τετραγώνῳ ἴσα ἐστὶ τὰ ἀπὸ τῶν ΕΔ καὶ ΔΒ τετράγωνα· τὸ ἄρα ὑπὸ τῶν ΓΖ καὶ ΖΔ περιεχόμενον ὀρθογώνιον μετὰ τοῦ ἀπὸ τῆς ΔΕ τετραγώνου ἴσον ἐστὶν τοῖς ἀπὸ τῶν ΕΔ, ΔΒ τετραγώνοις. καὶ κοινοῦ ἀφαιρεθέντος τοῦ ἀπὸ τῆς ΕΔ τετραγώνου λοιπὸν τὸ ὑπὸ τῶν ΓΖ καὶ ΖΔ ἴσον ἐστὶν τῷ ἀπὸ τῆς ΔΒ, τουτέστιν τῷ ἀπὸ τῆς ΔΓ· ἡ ΖΓ ἄρα ἄκρον καὶ μέσον λόγον τέτμηται κατὰ τὸ Δ. ἐπεὶ οὖν ἡ τοῦ ἑξαγώνου καὶ ἡ τοῦ δεκαγώνου πλευρὰ τῶν εἰς τὸν αὐτὸν κύκλον ἐγγραφομένων ἐπὶ τῆς αὐτῆς εὐθείας ἄκρον καὶ μέσον λόγον τέμνονται, ἡ δὲ ΓΔ ἐκ τοῦ κέντρου οὔσα τὴν τοῦ ἑξαγώνου περιέχει πλευράν, ἡ ΔΖ ἄρα ἐστὶν ἴση τῇ τοῦ δεκαγώνου πλευρᾷ. ὁμοίως δέ, ἐπεὶ ἡ τοῦ πενταγώνου πλευρὰ δύναται τὴν τε τοῦ ἑξαγώνου καὶ τὴν τοῦ δεκαγώνου τῶν εἰς τὸν αὐτὸν κύκλον ἐγγραφομένων, τοῦ δὲ ΒΔΖ ὀρθογωνίου τὸ ἀπὸ τῆς ΒΖ τετράγωνον ἴσον ἐστὶν τῷ τε ἀπὸ τῆς ΒΔ, ἥτις ἐστὶν ἑξαγώνου πλευρά, καὶ τῷ ἀπὸ τῆς ΔΖ, ἥτις ἐστὶν δεκαγώνου πλευρά, ἡ ΒΖ ἄρα ἴση ἐστὶν τῇ τοῦ πενταγώνου πλευρᾷ.

Ἐπεὶ οὖν, ὡς ἔφην, ὑποτιθέμεθα τὴν τοῦ κύκλου διάμετρον τμημάτων $\overline{ρκ}$, γίνεται διὰ τὰ προκείμενα ἡ μὲν ΔΕ ἡμίσεια οὔσα τῆς ἐκ τοῦ κέντρου

^a Following the usual practice, I shall denote *segments* (τμήματα) of the diameter by $\overline{}$, sixtieth parts of a τμήμα by

TRIGONOMETRY

For since the straight line $\Delta\Gamma$ is bisected at E, and the straight line ΔZ is added to it,

$$\begin{aligned}\Gamma Z \cdot Z\Delta + E\Delta^2 &= E\Delta^2 & [\text{Eucl. ii. 6}] \\ &= BE^2,\end{aligned}$$

since $EB = ZE$.

But $E\Delta^2 + \Delta B^2 = EB^2$; [Eucl. i. 47]

therefore $\Gamma Z \cdot Z\Delta + E\Delta^2 = E\Delta^2 + \Delta B^2$.

When the common term $E\Delta^2$ is taken away,

the remainder $\Gamma Z \cdot Z\Delta = \Delta B^2$

i.e., $= \Delta\Gamma^2$;

therefore $Z\Gamma$ is divided in extreme and mean ratio at Δ [Eucl. vi., Def. 3]. Therefore, since the side of the hexagon and the side of the decagon inscribed in the same circle when placed in one straight line are cut in extreme and mean ratio [Eucl. xiii. 9], and $\Gamma\Delta$, being a radius, is equal to the side of the hexagon [Eucl. iv. 15, coroll.], therefore ΔZ is equal to the side of the decagon. Similarly, since the square on the side of the pentagon is equal to the rectangle contained by the side of the hexagon and the side of the decagon inscribed in the same circle [Eucl. xiii. 10], and in the right-angled triangle $B\Delta Z$ the square on BZ is equal [Eucl. i. 47] to the sum of the squares on $B\Delta$, which is a side of the hexagon, and ΔZ , which is a side of the decagon, therefore BZ is equal to the side of the pentagon.

Then since, as I said, we made the diameter ^a consist of 120^o, by what has been stated ΔE , being half the numeral with a single accent, and second-sixtieths by the numeral with two accents. As the circular associations of the system tend to be forgotten, and it is used as a general system of enumeration, the same notation will be used for the *squares* of parts.

τμημάτων λ καὶ τὸ ἀπ' αὐτῆς λ , ἡ δὲ ΒΔ ἐκ τοῦ κέντρου οὔσα τμημάτων ξ καὶ τὸ ἀπὸ αὐτῆς $\overline{\gamma\chi}$, τὸ δὲ ἀπὸ τῆς ΕΒ, τουτέστιν τὸ ἀπὸ τῆς ΕΖ, τῶν ἐπὶ τὸ αὐτὸ $\delta\phi$ μήκει ἄρα ἔσται ἡ ΕΖ τμημάτων $\xi\xi$ δ $\overline{\nu\epsilon}$ ἔγγιστα, καὶ λοιπὴ ἡ ΔΖ τῶν αὐτῶν $\lambda\xi$ δ $\overline{\nu\epsilon}$. ἡ ἄρα τοῦ δεκαγώνου πλευρά, ὑποτείνουσα δὲ περιφέρειαν τοιούτων $\lambda\sigma$, οἷων ἐστὶν ὁ κύκλος $\overline{\tau\xi}$, τοιούτων ἔσται $\lambda\xi$ δ $\overline{\nu\epsilon}$, οἷων ἡ διάμετρος $\overline{\rho\kappa}$. πάλιν ἐπεὶ ἡ μὲν ΔΖ τμημάτων ἐστὶ $\lambda\xi$ δ $\overline{\nu\epsilon}$, τὸ δὲ ἀπὸ αὐτῆς $\overline{\alpha\tau\omicron\epsilon}$ δ $\overline{\iota\epsilon}$, ἔστι δὲ καὶ τὸ ἀπὸ τῆς ΔΒ τῶν αὐτῶν $\overline{\gamma\chi}$, ἃ συντεθέντα ποιεῖ τὸ ἀπὸ τῆς ΒΖ τετράγωνον $\delta\lambda\omicron\epsilon$ δ $\overline{\iota\epsilon}$, μήκει ἄρα ἔσται ἡ ΒΖ τμημάτων $\omicron\lambda\beta$ γ ἔγγιστα. καὶ ἡ τοῦ πενταγώνου ἄρα πλευρά, ὑποτείνουσα δὲ μοίρας $\omicron\beta$, οἷων ἐστὶν ὁ κύκλος $\overline{\tau\xi}$, τοιούτων ἐστὶν $\omicron\lambda\beta$ γ , οἷων ἡ διάμετρος $\overline{\rho\kappa}$.

Φανερόν δὲ αὐτόθεν, ὅτι καὶ ἡ τοῦ ἑξαγώνου πλευρά, ὑποτείνουσα δὲ μοίρας ξ , καὶ ἴση οὔσα τῇ ἐκ τοῦ κέντρου, τμημάτων ἐστὶν ξ . ὁμοίως δέ, ἐπεὶ ἡ μὲν τοῦ τετραγώνου πλευρά, ὑποτείνουσα δὲ μοίρας ζ , δυνάμει διπλασία ἐστὶν τῆς ἐκ τοῦ κέντρου, ἡ δὲ τοῦ τριγώνου πλευρά, ὑποτείνουσα δὲ μοίρας $\overline{\rho\kappa}$, δυνάμει τῆς αὐτῆς ἐστὶν τριπλασίων, τὸ δὲ ἀπὸ τῆς ἐκ τοῦ κέντρου τμημάτων ἐστὶν $\overline{\gamma\chi}$, συναχθήσεται τὸ μὲν ἀπὸ τῆς τοῦ τετραγώνου πλευρᾶς $\overline{\lambda\sigma}$, τὸ δὲ ἀπὸ τῆς τοῦ τριγώνου $\overline{\mathbf{M}\omega}$. ὥστε καὶ μήκει ἡ μὲν τὰς ζ μοίρας ὑποτείνουσα εὐθεῖα τοιούτων ἔσται $\overline{\pi\delta}$ $\overline{\nu\alpha}$ ι ἔγγιστα, οἷων ἡ

. TRIGONOMETRY

of the radius, consists of 30^p and its square of 900^p , and $B\Delta$, being the radius, consists of 60^p and its square of 3600^p , while EB^2 , that is EZ^2 , consists of 4500^p ; therefore EZ is approximately $67^p 4' 55''$,^a and the remainder ΔZ is $37^p 4' 55''$. Therefore the side of the decagon, subtending an arc of 36° (the whole circle consisting of 360°), is $37^p 4' 55''$ (the diameter being 120^p). Again, since ΔZ is $37^p 4' 55''$, its square is $1375^p 4' 15''$, and the square on ΔB is 3600^p , which added together make the square on BZ $4975^p 4' 15''$, so that BZ is approximately $70^p 32' 3''$. And therefore the side of the pentagon, subtending 72° (the circle consisting of 360°), is $70^p 32' 3''$ (the diameter being 120^p).

Hence it is clear that the side of the hexagon, subtending 60° and being equal to the radius, is 60^p . Similarly, since the square on the side of the square,^b subtending 90° , is double of the square on the radius, and the square on the side of the triangle, subtending 120° , is three times the square on the radius, while the square on the radius is 3600^p , the square on the side of the square is 7200^p and the square on the side of the triangle is 10800^p . Therefore the chord subtending 90° is approximately $84^p 51' 10''$ (the diameter

^a Theon's proof that $\sqrt{4500}$ is approximately $67^p 4' 55''$ has already been given (vol. i. pp. 56-61).

^b This is, of course, the square itself; the Greek phrase is not so difficult. We could translate, "the second power of the side of the square," but the notion of powers was outside the ken of the Greek mathematician.

Αἶδε μὲν οὕτως ἡμῖν ἐκ προχείρου καὶ καθ' αὐτὰς εἰλήφθωσαν, καὶ ἔσται φανερόν ἐντεῦθεν, ὅτι τῶν διδομένων εὐθειῶν ἕξ εὐχεροῦς δίδονται καὶ αἱ ὑπὸ τὰς λειπούσας εἰς τὸ ἡμικύκλιον περιφερείας ὑποτείνουσαι διὰ τὸ τὰ ἀπ' αὐτῶν συντιθέμενα ποιεῖν τὸ ἀπὸ τῆς διαμέτρου τετράγωνον οἶον, ἐπειδὴ ἡ ὑπὸ τὰς $\overline{λς}$ μοίρας εὐθεία τμημάτων ἐδείχθη $\overline{λζ}$ δ' $\overline{νε}$ καὶ τὸ ἀπ' αὐτῆς $\overline{ατοε}$ δ' $\overline{ιε}$, τὸ δὲ ἀπὸ τῆς διαμέτρου τμημάτων ἐστὶν $\overline{Μδ}$, ἔσται καὶ τὸ μὲν ἀπὸ τῆς ὑποτείνουσας τὰς λειπούσας εἰς τὸ ἡμικύκλιον μοίρας $\overline{ρμδ}$ τῶν λοιπῶν

^a Let AB be a chord of a circle subtending an angle α at the centre O, and let AKA' be drawn perpendicular to OB so as to meet OB in K and the circle again in A'. Then

$$\sin \alpha (= \sin AB) = \frac{AK}{AO} = \frac{\frac{1}{2}AA'}{AO}.$$

And AA' is the chord subtended by double of the arc AB, while Ptolemy expresses the lengths of chords as so many 120th parts of the diameter; therefore $\sin \alpha$ is half the chord subtended by an angle 2α at the centre, which is conveniently abbreviated by

Heath to $\frac{1}{2}(\text{crd. } 2\alpha)$, or, as we may alternatively express the relationship, $\sin AB$ is "half the chord subtended by

•TRIGONOMETRY

consisting of 120°), and the chord subtending 120° is $103^\circ 55' 23''$.^a

$$(iii.) \sin^2 \theta + \cos^2 \theta = 1$$

Ibid. 35. 17-36. 12

The lengths of these chords have thus been obtained immediately and by themselves,^b and it will be thence clear that, among the given straight lines, the lengths are immediately given of the chords subtending the remaining arcs in the semicircle, by reason of the fact that the sum of the squares on these chords is equal to the square on the diameter; for example, since the chord subtending 36° was shown to be $37^\circ 4' 55''$ and its square $1375^\circ 4' 15''$, while the square on the diameter is 14400° , therefore the square on the chord subtending the remaining 144° in the semicircle is

double of the arc AB," which is the Ptolemaic form; as Ptolemy means by this expression precisely what we mean by $\sin AB$, I shall interpolate the trigonometrical notation in the translation wherever it occurs. It follows that $\cos a$ [$=\sin(90-a)$] = $\frac{1}{2}$ crd. $(180^\circ-2a)$, or, as Ptolemy says, "half the chord subtended by the remaining angle in the semicircle." $\tan a$ and the other trigonometrical ratios were not used by the Greeks.

In the passage to which this note is appended Ptolemy proves that

side of decagon (=crd. $36^\circ=2 \sin 18^\circ$) = $37^\circ 4' 55''$,

side of pentagon (=crd. $72^\circ=2 \sin 36^\circ$) = $70^\circ 32' 3''$,

side of hexagon (=crd. $60^\circ=2 \sin 30^\circ$) = 60° ,

side of square (=crd. $90^\circ=2 \sin 45^\circ$) = $84^\circ 51' 10''$,

side of equilateral triangle (=crd. $120^\circ=2 \sin 60^\circ$) = $103^\circ 55' 23''$.

^b i.e., not deduced from other known chords.

• TRIGONOMETRY

angle $AB\Delta =$ the angle $EB\Gamma$. But the angle $B\Delta A =$ the angle $B\Gamma E$ [Eucl. iii. 21], for they subtend the same segment; therefore the triangle $AB\Delta$ is equiangular with the triangle $B\Gamma E$.

$$\therefore B\Gamma : \Gamma E = B\Delta : \Delta A ; \quad [\text{Eucl. vi. 4}]$$

$$\therefore B\Gamma \cdot A\Delta = B\Delta \cdot \Gamma E. \quad [\text{Eucl. vi. 6}]$$

Again, since the angle ABE is equal to the angle $\Delta B\Gamma$, while the angle BAE is equal to the angle $B\Delta\Gamma$ [Eucl. iii. 21], therefore the triangle ABE is equiangular with the triangle $B\Gamma\Delta$;

$$\therefore BA : AE = B\Delta : \Delta\Gamma ; \quad [\text{Eucl. vi. 4}]$$

$$\therefore BA \cdot \Delta\Gamma = B\Delta \cdot AE. \quad [\text{Eucl. vi. 6}]$$

But it was shown that

$$B\Gamma \cdot A\Delta = B\Delta \cdot \Gamma E ;$$

$$\text{and } \therefore A\Gamma \cdot B\Delta = AB \cdot \Delta\Gamma + A\Delta \cdot B\Gamma ; \quad [\text{Eucl. ii. 1}]$$

which was to be proved.

$$(v.) \sin(\theta - \phi) = \sin \theta \cos \phi - \cos \theta \sin \phi$$

Ibid. 37. 19-39. 3

This having first been proved, let $AB\Gamma\Delta$ be a semi-circle having $A\Delta$ for its diameter, and from A let the two [chords] AB , $A\Gamma$ be drawn, and let each of them be given in length, in terms of the 120th in the diameter, and let $B\Gamma$ be joined. I say that this also is given.

For let $B\Delta$, $\Gamma\Delta$ be joined; then clearly these also are given because they are the chords subtending the remainder of the semicircle. Then since $AB\Gamma\Delta$ is a quadrilateral in a circle,

ὑπὸ τῶν ΑΔ, ΒΓ ἴσον ἐστὶν τῷ ὑπὸ ΑΓ, ΒΔ.

TRIGONOMETRY

$$AB \cdot \Gamma\Delta + A\Delta \cdot B\Gamma = A\Gamma \cdot B\Delta.$$

[“ Ptolemy’s theorem ”

And $A\Gamma \cdot B\Delta$ is given, and also $AB \cdot \Gamma\Delta$; therefore the remaining term $A\Delta \cdot B\Gamma$ is also given. And $A\Delta$ is the diameter; therefore the straight line $B\Gamma$ is given.^a

And it has become clear to us that, if two arcs are given and the chords subtending them, the chord subtending the difference of the arcs will also be given. It is obvious that, by this theorem we can inscribe^b many other chords subtending the difference between given chords, and in particular we may obtain the chord subtending 12° , since we have that subtending 60° and that subtending 72° .

^a If $A\Gamma$ subtends an angle 2θ and AB an angle 2ϕ at the centre, the theorem asserts that

$$\text{crd. } (2\theta - 2\phi) \cdot (\text{crd. } 180^\circ) = (\text{crd. } 2\theta) \cdot (\text{crd. } 180^\circ - 2\phi) - (\text{crd. } 2\phi) \cdot (\text{crd. } 180^\circ - 2\theta)$$

i.e., $\sin (\theta - \phi) = \sin \theta \cos \phi - \cos \theta \sin \phi.$

^b Or “calculate,” as we might almost translate *ἐγγράφομεν*; cf. *supra*, p. 414 n. a on *ἐκ τῶν γραμμῶν*.

$$(vi.) \sin^2 \frac{1}{2}\theta = \frac{1}{2}(1 - \cos \theta)$$

Ibid. 39. 4-41. 3

Πάλιν προκείσθω δοθείσης τινὸς εὐθείας ἐν κύκλῳ τὴν ὑπὸ τὸ ἥμισυ τῆς ὑποτεينوμένης περιφέρειας εὐθείαν εὐρεῖν. καὶ ἔστω ἡμικύκλιον τὸ ΑΒΓ ἐπὶ διαμέτρου τῆς ΑΓ καὶ δοθείσα εὐθεῖα ἡ ΓΒ, καὶ ἡ ΓΒ περιφέρεια δίχα τετμήσθω κατὰ τὸ Δ, καὶ ἐπεζεύχθωσαν αἱ ΑΒ, ΑΔ, ΒΔ, ΔΓ, καὶ ἀπὸ τοῦ Δ ἐπὶ τὴν ΑΓ κάθετος ἦχθω ἡ ΔΖ. λέγω, ὅτι ἡ ΖΓ ἡμίσειά ἐστι τῆς τῶν ΑΒ καὶ ΑΓ ὑπεροχῆς.

Κείσθω γὰρ τῇ ΑΒ ἴση ἡ ΑΕ, καὶ ἐπεζεύχθω ἡ ΔΕ. ἐπεὶ ἴση ἐστὶν ἡ ΑΒ τῇ ΑΕ, κοινὴ δὲ ἡ ΑΔ, δύο δὴ αἱ ΑΒ, ΑΔ δύο ταῖς ΑΕ, ΑΔ ἴσαι εἰσὶν ἑκατέρα ἑκατέρᾳ. καὶ γωνία ἡ ὑπὸ ΒΑΔ γωνία τῇ ὑπὸ ΕΑΔ ἴση ἐστίν· καὶ βάσις ἄρα ἡ ΒΔ βάσει τῇ ΔΕ ἴση ἐστίν. ἀλλὰ ἡ ΒΔ τῇ ΔΓ ἴση ἐστίν· καὶ ἡ ΔΓ ἄρα τῇ ΔΕ ἴση ἐστίν. ἐπεὶ οὖν ἰσοσκελοῦς ὄντος τριγώνου τοῦ ΔΕΓ ἀπὸ τῆς κορυφῆς ἐπὶ τὴν βάσιν κάθετος ἦκται ἡ ΔΖ, ἴση ἐστὶν ἡ ΕΖ τῇ ΖΓ. ἀλλ' ἡ ΕΓ ὅλη ἡ ὑπεροχὴ ἐστὶν τῶν ΑΒ καὶ ΑΓ εὐθειῶν· ἡ ἄρα ΖΓ ἡμίσειά ἐστιν τῆς τῶν αὐτῶν ὑπεροχῆς. ὥστε, ἐπεὶ τῆς ὑπὸ τὴν ΒΓ περιφέρειαν εὐθείας ὑποκειμένης

TRIGONOMETRY

$$(vi.) \sin^2 \frac{1}{2}\theta = \frac{1}{2}(1 - \cos \theta)$$

Ibid. 39. 4-41. 3

Again, given any chord in a circle, let it be required to find the chord subtending half the arc subtended by the given chord. Let $AB\Gamma$ be a semicircle upon the diameter $A\Gamma$ and let the chord ΓB be given, and

let the arc ΓB be bisected at Δ , and let AB , $A\Delta$, $B\Delta$, $\Delta\Gamma$ be joined, and from Δ let ΔZ be drawn perpendicular to $A\Gamma$. I say that $Z\Gamma$ is half of the difference between AB and $A\Gamma$.

For let AE be placed equal to AB , and let ΔE be joined. Since $AB = AE$ and $A\Delta$ is common, [in the triangles $AB\Delta$, $AE\Delta$] the two [sides] AB , $A\Delta$ are equal to AE , $A\Delta$ each to each; and the angle $BA\Delta$ is equal to the angle $EA\Delta$ [Eucl. iii. 27]; and therefore the base $B\Delta$ is equal to the base ΔE [Eucl. i. 4]. But $B\Delta = \Delta\Gamma$; and therefore $\Delta\Gamma = \Delta E$. Then since the triangle $\Delta E\Gamma$ is isosceles and ΔZ has been drawn from the vertex perpendicular to the base, $EZ = Z\Gamma$ [Eucl. i. 26]. But the whole $E\Gamma$ is the difference between the chords AB and $A\Gamma$; therefore $Z\Gamma$ is half of the difference. Thus, since the chord subtending the arc $B\Gamma$ is given, the chord AB subtending the remainder

αὐτόθεν δέδουται καὶ ἡ λείπουσα εἰς τὸ ἡμικύκλιον ἡ AB , δοθήσεται καὶ ἡ $Z\Gamma$ ἡμίσεια οὖσα τῆς τῶν $ΑΓ$ καὶ AB ὑπεροχῆς· ἀλλ' ἐπεὶ ἐν ὀρθογωνίῳ τῷ $ΑΓΔ$ καθέτου ἀχθείσης τῆς $ΔΖ$ ἰσογώνιον γίνεται τὸ $ΑΔΓ$ ὀρθογώνιον τῷ $ΔΓΖ$, καὶ ἐστίν, ὥς ἡ $ΑΓ$ πρὸς $ΓΔ$, ἡ $ΓΔ$ πρὸς $ΓΖ$, τὸ ἄρα ὑπὸ τῶν $ΑΓ$, $ΓΖ$ περιεχόμενον ὀρθογώνιον ἴσον ἐστὶν τῷ ἀπὸ τῆς $ΓΔ$ τετραγώνῳ. δοθέν δὲ τὸ ὑπὸ τῶν $ΑΓ$, $ΓΖ$. δοθέν ἄρα ἐστὶν καὶ τὸ ἀπὸ τῆς $ΓΔ$ τετραγώνον. ὥστε καὶ μήκει ἡ $ΓΔ$ εὐθεῖα δοθήσεται τὴν ἡμίσειαν ὑποτείνουσα τῆς $ΒΓ$ περιφέρειας.

Καὶ διὰ τούτου δὴ πάλιν τοῦ θεωρήματος ἄλλαι τε ληφθήσονται πλείσται κατὰ τὰς ἡμισείας τῶν προεκτεθειμένων, καὶ δὴ καὶ ἀπὸ τῆς τὰς $\bar{\iota}\beta$ μοίρας ὑποτείνουσας εὐθείας ἥ τε ὑπὸ τὰς $\bar{\epsilon}$ καὶ ἡ ὑπὸ τὰς $\bar{\gamma}$ καὶ ἡ ὑπὸ τὴν μίαν ἡμισυ καὶ ἡ ὑπὸ τὸ ἡμισυ τέταρτον τῆς μιᾶς μοίρας. εὐρίσκομεν δὲ ἐκ τῶν ἐπιλογισμῶν τὴν μὲν ὑπὸ τὴν μίαν ἡμισυ μοῖραν τοιούτων \bar{a} $\bar{\lambda}\delta$ $\bar{\iota}\epsilon$ ἔγγιστα, οἷων ἐστὶν ἡ διάμετρος $\bar{\rho}\kappa$, τὴν δὲ ὑπὸ τὸ \angle' δ' τῶν αὐτῶν O $\mu\zeta$ η .

$$(vii.) \cos(\theta + \phi) = \cos \theta \cos \phi - \sin \theta \sin \phi$$

Ibid. 41. 4-13. 5

Πάλιν ἔστω κύκλος δ $ΑΒΓΔ$ περὶ διάμετρον μὲν τὴν $ΑΔ$, κέντρον δὲ τὸ Z , καὶ ἀπὸ τοῦ A ἀπειλήφθωσαν δύο περιφέρειαι δοθεῖσαι κατὰ τὸ ἐξῆς αἱ $ΑΒ$, $ΒΓ$, καὶ ἐπεζεύχθωσαν αἱ $ΑΒ$, $ΒΓ$ ὑπ' αὐτὰς εὐθεῖαι καὶ αὐταὶ δεδομέναι. λέγω ὅτι, ἐὰν ἐπιζεύξωμεν τὴν $ΑΓ$, δοθήσεται καὶ αὕτη.

^a If $B\Gamma$ subtends an angle 2θ at the centre the proposition asserts that

.TRIGONOMETRY

of the semicircle is immediately given, and $Z\Gamma$ will also be given, being half of the difference between $A\Gamma$ and AB . But since the perpendicular ΔZ has been drawn in the right-angled triangle $A\Gamma\Delta$, the right-angled triangle $A\Delta\Gamma$ is equiangular with $\Delta\Gamma Z$ [Eucl. vi. 8], and

$$A\Gamma : \Gamma\Delta = \Gamma\Delta : \Gamma Z,$$

and therefore $A\Gamma \cdot \Gamma Z = \Gamma\Delta^2$.

But $A\Gamma \cdot \Gamma Z$ is given; therefore $\Gamma\Delta^2$ is also given. Therefore the chord $\Gamma\Delta$, subtending half of the arc $B\Gamma$, is also given.^a

And again by this theorem many other chords can be obtained as the halves of known chords, and in particular from the chord subtending 12° can be obtained the chord subtending 6° and that subtending 3° and that subtending $1\frac{1}{2}^\circ$ and that subtending $\frac{1}{2}^\circ + \frac{1}{4}^\circ (= \frac{3}{4}^\circ)$. We shall find, when we come to make the calculation, that the chord subtending $1\frac{1}{2}^\circ$ is approximately $1^\circ 34' 15''$ (the diameter being 120°) and that subtending $\frac{3}{4}^\circ$ is $0^\circ 47' 8''$.^b

$$(vii.) \cos(\theta + \phi) = \cos \theta \cos \phi - \sin \theta \sin \phi$$

Ibid. 41. 4-43. 5

Again, let $AB\Gamma\Delta$ be a circle about the diameter $A\Delta$ and with centre Z , and from A let there be cut off in succession two given arcs AB , $B\Gamma$, and let there be joined AB , $B\Gamma$, which, being the chords subtending them, are also given. I say that, if we join $A\Gamma$, it also will be given.

$$(\text{crd. } \theta)^2 = \frac{1}{2}(\text{crd. } 180) \cdot \{(\text{crd. } 180^\circ) - \text{crd. } 180^\circ - 2\theta\}$$

$$\text{i.e., } \sin^2 \frac{1}{2}\theta = \frac{1}{2}(1 - \cos \theta).$$

^b The symbol in the Greek for \circ should be noted; *v.* vol. i. p. 47 n. a.

Διήχθω γὰρ διὰ τοῦ Β διάμετρος τοῦ κύκλου ἡ ΒΖΕ, καὶ ἐπεζεύχθωσαν αἱ ΒΔ, ΔΓ, ΓΕ, ΔΕ· δηλον δὴ αὐτόθεν, ὅτι διὰ μὲν τὴν ΒΓ δοθήσεται καὶ ἡ ΓΕ, διὰ δὲ τὴν ΑΒ δοθήσεται ἡ τε ΒΔ καὶ ἡ ΔΕ. καὶ διὰ τὰ αὐτὰ τοῖς ἔμπροσθεν, ἐπεὶ ἐν κύκλῳ τετράπλευρόν ἐστὶν τὸ ΒΓΔΕ, καὶ διηγμέναι εἰσὶν αἱ ΒΔ, ΓΕ, τὸ ὑπὸ τῶν διηγμένων περιεχόμενον ὀρθογώνιον ἴσον ἐστὶν συναμφοτέροις τοῖς ὑπὸ τῶν ἀπεναντίον· ὥστε, ἐπεὶ δεδομένου τοῦ ὑπὸ τῶν ΒΔ, ΓΕ δέδοται καὶ τὸ ὑπὸ τῶν ΒΓ, ΔΕ, δέδοται ἄρα καὶ τὸ ὑπὸ ΒΕ, ΓΔ. δέδοται δὲ καὶ ἡ ΒΕ διάμετρος, καὶ λοιπὴ ἡ ΓΔ ἔσται δεδομένη, καὶ διὰ τοῦτο καὶ ἡ λείπουσα εἰς τὸ ἡμικύκλιον ἡ ΓΑ· ὥστε, ἐὰν δοθῶσιν δύο περιφέρειαι καὶ αἱ ὑπ' αὐτὰς εὐθεῖαι, δοθήσεται καὶ ἡ συναμφοτέρας τὰς περιφερείας κατὰ σύνθεσιν ὑποτείνουσα εὐθεῖα διὰ τούτου τοῦ θεωρήματος.

* If AB subtends an angle 2θ and BI' an angle 2ϕ at the centre, the theorem asserts that

$$(\text{crd. } 180^\circ) \cdot (\text{crd. } 180^\circ - 2\theta - 2\phi) = (\text{crd. } 180^\circ - 2\theta) \cdot (\text{crd. } 180^\circ - 2\phi) - (\text{crd. } 2\theta) \cdot (\text{crd. } 2\phi),$$

$$\text{i.e.,} \quad \cos(\theta + \phi) = \cos \theta \cos \phi - \sin \theta \sin \phi.$$

TRIGONOMETRY

For through B let BZE, the diameter of the circle, be drawn, and let B Δ , $\Delta\Gamma$, ΓE , ΔE be joined; it is

then immediately obvious that, by reason of B Γ being given, ΓE is also given, and by reason of AB being given, both B Δ and ΔE are given. And by the same reasoning as before, since B $\Gamma\Delta E$ is a quadrilateral in a circle, and B Δ , ΓE are the diagonals, the rectangle contained by the diagonals is equal to the sum of the rectangles contained by the opposite sides. And so, since B $\Delta \cdot \Gamma E$ is given, while B $\Gamma \cdot \Delta E$ is also given, therefore BE $\cdot \Gamma\Delta$ is given. But the diameter BE is given, and [therefore] the remaining term $\Gamma\Delta$ will be given, and therefore the chord ΓA subtending the remainder of the semicircle^a; accordingly, if two arcs be given, and the chords subtending them, by this theorem the chord subtending the sum of the arcs will also be given.

Φανερόν δέ, ὅτι συντιθέντες αἰεὶ μετὰ τῶν προεκτεθειμένων πασῶν τὴν ὑπὸ $\bar{a} \angle'$ μοῖραν καὶ τὰς συναπτομένας ἐπιλογιζόμενοι πάσας ἀπλῶς ἐγγράψομεν, ὅσαι δις γινόμεναι τρίτον μέρος ἔξουσιν, καὶ μόναι ἔτι περιλειφθήσονται αἱ μεταξὺ τῶν ἀνὰ $\bar{a} \angle'$ μοῖραν διαστημάτων δύο καθ' ἕκαστον ἐσόμεναι, ἐπειδὴ περ καθ' ἡμιμοίριον ποιούμεθα τὴν ἐγγραφὴν. ὥστε, εἰς τὴν ὑπὸ τὸ ἡμιμοίριον εὐθείαν εὗρωμεν, αὕτη κατὰ τε τὴν σύνθεσιν καὶ τὴν ὑπεροχὴν τὴν πρὸς τὰς τὰ διαστήματα περιεχούσας καὶ δεδομένας εὐθείας καὶ τὰς λοιπὰς τὰς μεταξὺ πάσους ἡμῖν συναναπληρώσει. ἐπεὶ δὲ δοθείσης τινὸς εὐθείας ὡς τῆς ὑπὸ τὴν $\bar{a} \angle'$ μοῖραν ἢ τὸ τρίτον τῆς αὐτῆς περιφέρειας ὑποτείνουσα διὰ τῶν γραμμῶν οὐ δίδοται πως· εἰ δέ γε δυνατόν ἦν, εἴχομεν ἂν αὐτόθεν καὶ τὴν ὑπὸ τὸ ἡμιμοίριον· πρότερον μεθοδεύσομεν τὴν ὑπὸ τὴν \bar{a} μοῖραν ἀπὸ τε τῆς ὑπὸ τὴν $\bar{a} \angle'$ μοῖραν καὶ τῆς ὑπὸ \angle' δ' ὑποτεθέμενοι λημμάτιον, ὃ, καὶ μὴ πρὸς τὸ καθόλου δύνηται τὰς πηλικότητας ὀρίζειν, ἐπὶ γε τῶν οὕτως ἐλαχίστων τὸ πρὸς τὰς ὠρισμένας ἀπαράλλακτον δύναιτ' ἂν συντηρεῖν.

Λέγω γάρ, ὅτι εἰς τὸν κύκλῳ διαχθῶσιν ἄνισοι δύο εὐθεῖαι, ἡ μείζων πρὸς τὴν ἐλάσσονα ἐλάσσονα λόγον ἔχει ἢ περ ἢ ἐπὶ τῆς μείζονος εὐθείας περιφέρειᾳ πρὸς τὴν ἐπὶ τῆς ἐλάσσονος.

Ἐστω γὰρ κύκλος ὁ ΑΒΓΔ, καὶ διήχθωσαν ἐν αὐτῷ δύο εὐθεῖαι ἄνισοι ἐλάσσων μὲν ἢ ΑΒ,

. TRIGONOMETRY

It is clear that, by continually putting next to all known chords a chord subtending $1\frac{1}{2}^\circ$ and calculating the chords joining them, we may compute in a simple manner all chords subtending multiples of $1\frac{1}{2}^\circ$, and there will still be left only those within the $1\frac{1}{2}^\circ$ intervals—two in each case, since we are making the diagram in half degrees. Therefore, if we find the chord subtending $\frac{1}{2}^\circ$, this will enable us to complete, by the method of addition and subtraction with respect to the chords bounding the intervals, both the given chords and all the remaining, intervening chords. But when any chord subtending, say, $1\frac{1}{2}^\circ$, is given, the chord subtending the third part of the same arc is not given by the [above] calculations—if it were, we should obtain immediately the chord subtending $\frac{1}{2}^\circ$; therefore we shall first give a method for finding the chord subtending 1° from the chord subtending $1\frac{1}{2}^\circ$ and that subtending $\frac{3}{4}^\circ$, assuming a little lemma which, even though it cannot be used for calculating lengths in general, in the case of such small chords will enable us to make an approximation indistinguishable from the correct figure.

(viii.) *Method of Interpolation*

Ibid. 43. 6—46. 20

For I say that, *if two unequal chords be drawn in a circle, the greater will bear to the less a less ratio than that which the arc on the greater chord bears to the arc on the lesser.*

For let $AB\Gamma\Delta$ be a circle, and in it let there be drawn two unequal chords, of which AB is the lesser

μείζων δὲ ἡ ΒΓ. λέγω, ὅτι ἡ ΓΒ εὐθεῖα πρὸς τὴν ΒΑ εὐθείαν ἐλάσσονα λόγον ἔχει ἥπερ ἡ ΒΓ περιφέρεια πρὸς τὴν ΒΑ περιφέρειαν.

Τετμήσθω γὰρ ἡ ὑπὸ ΑΒΓ γωνία δίχα ὑπὸ τῆς ΒΔ, καὶ ἐπεζεύχθωσαν ἡ τε ΑΕΓ καὶ ἡ ΑΔ καὶ ἡ ΓΔ. καὶ ἐπεὶ ἡ ὑπὸ ΑΒΓ γωνία δίχα τέτμηται ὑπὸ τῆς ΒΕΔ εὐθείας, ἴση μὲν ἐστὶν ἡ ΓΔ εὐθεῖα τῇ ΑΔ, μείζων δὲ ἡ ΓΕ τῆς ΕΑ. ἤχθω δὴ ἀπὸ τοῦ Δ κάθετος ἐπὶ τὴν ΑΕΓ ἡ ΔΖ. ἐπεὶ τοίνυν μείζων ἐστὶν ἡ μὲν ΑΔ τῆς ΕΔ, ἡ δὲ ΕΔ τῆς ΔΖ, ὁ ἄρα κέντρῳ μὲν τῷ Δ, διαστήματι δὲ τῷ ΔΕ γραφόμενος κύκλος τὴν μὲν ΑΔ τεμεῖ, ὑπερπεσεῖται δὲ τὴν ΔΖ. γεγράφθω δὴ ὁ ΗΕΘ, καὶ ἐκβεβλήσθω ἡ ΔΖΘ. καὶ ἐπεὶ ὁ μὲν ΔΗΘ τομεὺς μείζων ἐστὶν τοῦ ΔΕΖ τριγώνου, τὸ δὲ ΔΕΑ τρίγωνον μείζον τοῦ ΔΕΗ τομέως, τὸ ἄρα ΔΕΖ

^a Lit. "let ΔΖΘ be produced."

• TRIGONOMETRY

and $B\Gamma$ the greater. I say that

$$\Gamma B : BA < \text{arc } B\Gamma : \text{arc } BA.$$

For let the angle $AB\Gamma$ be bisected by $B\Delta$, and let

$A\Gamma$ and $A\Delta$ and $\Gamma\Delta$ be joined. Then since the angle $AB\Gamma$ is bisected by the chord $BE\Delta$, the chord $\Gamma\Delta = A\Delta$ [Eucl. iii. 26, 29], while $\Gamma E > EA$ [Eucl. vi. 3]. Now let ΔZ be drawn from Δ perpendicular to $A\Gamma$. Then since $A\Delta > E\Delta$, and $E\Delta > \Delta Z$, the circle described with centre Δ and radius ΔE will cut $A\Delta$, and will fall beyond ΔZ . Let [the arc] $HE\Theta$ be described, and let ΔZ be produced to Θ .^a Then since

sector $\Delta E\Theta > \text{triangle } \Delta EZ$,

and triangle $\Delta EA > \text{sector } \Delta EH$,

τρίγωνον πρὸς τὸ ΔΕΑ τρίγωνον ἐλάσσονα λόγον
 ἔχει ἥπερ ὁ ΔΕΘ τομεὺς πρὸς τὸν ΔΕΗ. ἀλλ'
 ὡς μὲν τὸ ΔΕΖ τρίγωνον πρὸς τὸ ΔΕΑ τρίγωνον,

TRIGONOMETRY

\therefore triangle $\triangle EZ$: triangle $\triangle EA$ < sector $\triangle E\theta$:
sector $\triangle EH$.

But triangle $\triangle EZ$: triangle $\triangle EA = EZ : EA$,
[Eucl. vi. 1

and

sector $\triangle E\theta$: sector $\triangle EH = \text{angle } Z\Delta E : \text{angle } E\Delta A$.

\therefore $ZE : EA < \text{angle } Z\Delta E : \text{angle } E\Delta A$.

\therefore *componendo*, $ZA : EA < \text{angle } Z\Delta A : \text{angle } A\Delta E$;

and, by doubling the antecedents,

$\Gamma A : AE < \text{angle } \Gamma\Delta A : \text{angle } E\Delta A$;

and *dirimendo*, $\Gamma E : EA < \text{angle } \Gamma\Delta E : \text{angle } E\Delta A$.

But $\Gamma E : EA = \Gamma B : BA$, [Eucl. vi. 3

and

$\text{angle } \Gamma\Delta B : \text{angle } B\Delta A = \text{arc } \Gamma B : \text{arc } BA$;
[Eucl. vi. 33

\therefore $\Gamma B : BA < \text{arc } \Gamma B : \text{arc } BA$.^a

On this basis, then, let $AB\Gamma$ be a circle, and in it let there be drawn the two chords AB and $A\Gamma$, and let it first be supposed that AB subtends an angle of $\frac{2}{3}^\circ$ and $A\Gamma$ an angle of 1° . Then since

$A\Gamma : BA < \text{arc } A\Gamma : \text{arc } AB$,

while $\text{arc } A\Gamma = \frac{1}{3} \cdot \text{arc } AB$,

\therefore $\Gamma A : BA < \frac{1}{3}$.

But the chord AB was shown to be $0^\circ 47' 8''$ (the diameter being 120°); therefore the chord ΓA

^a If the chords ΓB , BA subtend angles 2θ , 2ϕ at the centre, this is equivalent to the formula,

$$\frac{\sin \theta}{\sin \phi} < \frac{\theta}{\phi},$$

where $\theta < \phi < \frac{1}{2}\pi$.

GREEK MATHEMATICS

εὐθεῖα ἐλάσσων ἐστὶν τῶν αὐτῶν $\bar{\alpha} \bar{\beta} \bar{\nu}$. ταῦτα γὰρ ἐπίτρυτά ἐστιν ἔγγιστα τῶν $\text{O} \bar{\mu} \bar{\zeta} \bar{\eta}$.

Πάλιν ἐπὶ τῆς αὐτῆς καταγραφῆς ἡ μὲν ΑΒ εὐθεῖα ὑποκείσθω ὑποτείνουσα μοῖραν $\bar{\alpha}$, ἡ δὲ ΑΓ μοῖραν $\bar{\alpha} \angle'$. κατὰ τὰ αὐτὰ δὴ, ἐπεὶ ἡ ΑΓ περιφέρεια τῆς ΑΒ ἐστὶν ἡμιολία, ἡ ΓΑ ἄρα εὐθεῖα τῆς ΒΑ ἐλάσσων ἐστὶν ἢ ἡμιόλιος. ἀλλὰ τὴν ΑΓ ἀπεδείξαμεν τοιούτων οὔσαν $\bar{\alpha} \bar{\lambda} \bar{\delta} \bar{\iota} \bar{\epsilon}$, οἷων ἐστὶν ἡ διάμετρος $\bar{\rho} \bar{\kappa}$. ἡ ἄρα ΑΒ εὐθεῖα μείζων ἐστὶν τῶν αὐτῶν $\bar{\alpha} \bar{\beta} \bar{\nu}$. τούτων γὰρ ἡμιολία ἐστὶν τὰ προκείμενα $\bar{\alpha} \bar{\lambda} \bar{\delta} \bar{\iota} \bar{\epsilon}$. ὥστε, ἐπεὶ τῶν αὐτῶν ἐδείχθη καὶ μείζων καὶ ἐλάσσων ἢ τὴν μίαν μοῖραν ὑποτείνουσα εὐθεῖα, καὶ ταύτην δηλονότι ἔξομεν τοιούτων $\bar{\alpha} \bar{\beta} \bar{\nu}$ ἔγγιστα, οἷων ἐστὶν ἡ διάμετρος $\bar{\rho} \bar{\kappa}$, καὶ διὰ τὰ προδεδειγμένα καὶ τὴν ὑπὸ τὸ ἡμιμοίριον, ἥτις εὐρίσκεται τῶν αὐτῶν

TRIGONOMETRY

$< 1^\circ 2' 50''$; for this is approximately four-thirds of $0^\circ 47' 8''$.

Again, with the same diagram, let the chord AB

be supposed to subtend an angle of 1° , and $A\Gamma$ an angle of $1\frac{1}{2}^\circ$. By the same reasoning,

since $\text{arc } A\Gamma = \frac{3}{2} \cdot \text{arc } AB$,

$\therefore \Gamma A : BA < \frac{3}{2}$.

But we have proved $A\Gamma$ to be $1^\circ 34' 15''$ (the diameter being 120°); therefore the chord $AB > 1^\circ 2' 50''$; for $1^\circ 34' 15''$ is one-and-a-half times this number. Therefore, since the chord subtending an angle of 1° has been shown to be both greater and less than [approximately] the same [length], manifestly we shall find it to have approximately this identical value $1^\circ 2' 50''$ (the diameter being 120°), and by what has been proved before we shall obtain the chord subtending $\frac{1}{2}^\circ$, which is found to be approximately

Ο $\overline{\lambda\alpha}$ $\overline{\kappa\epsilon}$ ἔγγιστα. καὶ συναναπληρωθήσεται τὰ λοιπά, ὡς ἔφαμεν, διαστήματα ἐκ μὲν τῆς πρὸς τὴν μίαν ἡμισυ μοῖραν λόγου ἔνεκεν ὡς ἐπὶ τοῦ πρώτου διαστήματος συνθέσεως τοῦ ἡμιμορίου δεικνυμένης τῆς ὑπὸ τὰς β μοῖρας, ἐκ δὲ τῆς ὑπεροχῆς τῆς πρὸς τὰς γ μοῖρας καὶ τῆς ὑπὸ τὰς β \angle' διδομένης· ὡσαύτως δὲ καὶ ἐπὶ τῶν λοιπῶν.

Ibid. 46. 21-63. 46

Ἡ μὲν οὖν πραγματεία τῶν ἐν τῷ κύκλῳ εὐθειῶν οὕτως ἂν οἶμαι ῥᾶστα μεταχειρισθῇ. ἵνα δέ, ὡς ἔφην, ἐφ' ἐκάστης τῶν χρειῶν ἐξ ἐτοίμου τὰς πηλικότητας ἔχωμεν τῶν εὐθειῶν ἐκκειμένας, κανόνια ὑποτάξομεν ἀνὰ στίχους $\overline{\mu\epsilon}$ διὰ τὸ σύμμετρον, ὧν τὰ μὲν πρῶτα μέρη περιέξει τὰς πηλικότητας τῶν περιφερειῶν καθ' ἡμιμορίου παρηυξήμενας, τὰ δὲ δεύτερα τὰς τῶν παρακειμένων ταῖς περιφερείαις εὐθειῶν πηλικότητας ὡς τῆς διαμέτρου τῶν $\overline{\rho\kappa}$ τμημάτων ὑποκειμένης, τὰ δὲ τρίτα τὸ λ' μέρος τῆς καθ' ἕκαστον ἡμιμορίου τῶν εὐθειῶν παραυξήσεως, ἵνα ἔχοντες καὶ τὴν τοῦ ἐνὸς ἐξηκοστοῦ μέσσην ἐπιβολὴν ἀδιαφοροῦσαν πρὸς αἴσθησιν τῆς ἀκριβοῦς καὶ τῶν μεταξὺ τοῦ ἡμίσεος μερῶν ἐξ ἐτοίμου τὰς ἐπιβαλλούσας πηλικότητας ἐπιλογίζεσθαι δυνώμεθα. εὐκατανόητον δ', ὅτι διὰ τῶν αὐτῶν καὶ προκειμένων θεωρημάτων, καὶ ἐν δισταγμῷ γενώμεθα γραφικῆς ἀμαρτίας περὶ τινα τῶν ἐν τῷ κανονίῳ παρακειμένων εὐθειῶν, ῥαδίαν ποιησόμεθα τὴν τε ἐξέτασιν καὶ τὴν

TRIGONOMETRY

$0^{\circ} 31' 25''$. The remaining intervals may be completed, as we said, by means of the chord subtending $1\frac{1}{2}^{\circ}$ —in the case of the first interval, for example, by adding $\frac{1}{2}^{\circ}$ we obtain the chord subtending 2° , and from the difference between this and 3° we obtain the chord subtending $2\frac{1}{2}^{\circ}$, and so on for the remainder.

(ix.) *The Table*

Ibid. 46, 21–63, 46

The theory of the chords in the circle may thus, I think, be very easily grasped. In order that, as I said, we may have the lengths of all the chords in common use immediately available, we shall draw up tables arranged in forty-five symmetrical rows.^a The first section will contain the magnitudes of the arcs increasing by half degrees, the second will contain the lengths of the chords subtending the arcs measured in parts of which the diameter contains 120, and the third will give the thirtieth part of the increase in the chords for each half degree, in order that for every sixtieth part of a degree we may have a mean approximation differing imperceptibly from the true figure and so be able readily to calculate the lengths corresponding to the fractions between the half degrees. It should be well noted that, by these same theorems now before us, if we should suspect an error in the computation of any of the chords in the table,^b we can easily make a test and

^a As there are 360 half degrees in the table, the statement appears to mean that the table occupied eight pages each of 45 rows; so Manitius, *Des Claudius Ptolemæus Handbuch der Astronomie*, 1^{er} Bd., p. 35 n. a.

^b Such an error might be accumulated by using the approximations for 1° and $\frac{1}{2}^{\circ}$; but, in fact, the sines in the table are generally correct to five places of decimals.

(c) MENELAUS'S THEOREM

(i.) Lemmas

Ibid. 68. 14-74. 8

13. Preliminary matter for the spherical proofs

The next subject for investigation being to show the lengths of the arcs, intercepted between the celestial equator and the zodiac circle, of great circles drawn through the poles of the equator, we shall set out some brief and serviceable little lemmas, by means of which we shall be able to prove more simply and more systematically most of the questions investigated spherically.

Let two straight lines BE and I'Δ be drawn so as

to meet the straight lines AB and AΓ and to cut one

κατὰ τὸ Z σημείον. λέγω, ὅτι ὁ τῆς ΓA πρὸς $A E$ λόγος συνήπται ἔκ τε τοῦ τῆς $\Gamma \Delta$ πρὸς ΔZ καὶ τοῦ τῆς $Z B$ πρὸς $B E$.

Ἦχθω γὰρ διὰ τοῦ E τῇ $\Gamma \Delta$ παράλληλος ἡ $E H$. ἐπεὶ παράλληλοί εἰσιν αἱ $\Gamma \Delta$ καὶ $E H$, ὁ τῆς ΓA πρὸς $E A$ λόγος ὁ αὐτός ἐστιν τῷ τῆς $\Gamma \Delta$ πρὸς $E H$. ἔξωθεν δὲ ἡ $Z \Delta$. ὁ ἄρα τῆς $\Gamma \Delta$ πρὸς $E H$ λόγος συγκείμενος ἔσται ἔκ τε τοῦ τῆς $\Gamma \Delta$ πρὸς ΔZ καὶ τοῦ τῆς ΔZ πρὸς $H E$. ὥστε καὶ ὁ τῆς ΓA πρὸς $A E$ λόγος σύγκειται ἔκ τε τοῦ τῆς $\Gamma \Delta$ πρὸς ΔZ καὶ τοῦ τῆς ΔZ πρὸς $H E$. ἔστιν δὲ καὶ ὁ τῆς ΔZ πρὸς $H E$ λόγος ὁ αὐτός τῷ τῆς $Z B$ πρὸς $B E$ διὰ τὸ παραλλήλους πάλιν εἶναι τὰς $E H$ καὶ $Z \Delta$. ὁ ἄρα τῆς ΓA πρὸς $A E$ λόγος σύγκειται ἔκ τε τοῦ τῆς $\Gamma \Delta$ πρὸς ΔZ καὶ τοῦ τῆς $Z B$ πρὸς $B E$. ὅπερ προέκειτο δεῖξαι.

Κατὰ τὰ αὐτὰ δὲ δειχθήσεται, ὅτι καὶ κατὰ διαίρεσιν ὁ τῆς ΓE πρὸς $E A$ λόγος συνήπται ἔκ τε τοῦ τῆς ΓZ πρὸς ΔZ καὶ τοῦ τῆς ΔB πρὸς $B A$, διὰ τοῦ A τῇ $E B$ παραλλήλου ἀχθείσης καὶ

^a Lit. "the ratio of ΓA to $A E$ is compounded of the ratio of $\Gamma \Delta$ to ΔZ and $Z B$ to $B E$."

TRIGONOMETRY

another at the point Z. I say that

$$\Gamma A : AE = (\Gamma \Delta : \Delta Z)(ZB : BE).^a$$

For through E let EH be drawn parallel to $\Gamma \Delta$. Since $\Gamma \Delta$ and EH are parallel,

$$\Gamma A : EA = \Gamma \Delta : EH. \quad [\text{Eucl. vi. 1}]$$

But Z Δ is an external [straight line];

$$\therefore \Gamma \Delta : EH = (\Gamma \Delta : \Delta Z)(\Delta Z : HE);$$

$$\therefore \Gamma A : AE = (\Gamma \Delta : \Delta Z)(\Delta Z : HE).$$

$$\text{But } \Delta Z : HE = ZB : BE, \quad [\text{Eucl. vi. 4}]$$

by reason of the fact that EH and Z Δ are parallels;

$$\therefore \Gamma A : AE = (\Gamma \Delta : \Delta Z)(ZB : BE); \quad (1)$$

which was set to be proved.

With the same premises, it will be shown by transformation of ratios that

$$\Gamma E : EA = (\Gamma Z : \Delta Z)(\Delta B : BA),$$

^a a parallel to EB being drawn through A and $\Gamma \Delta$ H

προσεκβληθείσης ἐπ' αὐτὴν τῆς ΓΔΗ. ἐπεὶ γὰρ
 πάλιν παράλληλός ἐστιν ἡ ΑΗ τῇ ΕΖ, ἔστιν, ὥς
 ἡ ΓΕ πρὸς ΕΑ, ἡ ΓΖ πρὸς ΖΗ. ἀλλὰ τῆς ΖΔ
 ἔξωθεν λαμβανομένης ὁ τῆς ΓΖ πρὸς ΖΗ λόγος
 σύγκειται ἔκ τε τοῦ τῆς ΓΖ πρὸς ΖΔ καὶ τοῦ τῆς
 ΔΖ πρὸς ΖΗ· ἔστιν δὲ ὁ τῆς ΔΖ πρὸς ΖΗ λόγος
 ὁ αὐτός τῳ τῆς ΔΒ πρὸς ΒΑ διὰ τὸ εἰς παραλ-
 λήλους τὰς ΑΗ καὶ ΖΒ διηχθαι τὰς ΒΑ καὶ ΖΗ·

 λόγος σύγκειται ἔκ τε τοῦ τῆς ΓΖ πρὸς ΔΖ
 καὶ τοῦ τῆς ΔΒ πρὸς ΒΑ· ὅπερ ἔδει δεῖξαι.

Πάλιν ἔστω κύκλος ὁ ΑΒΓ, οὗ κέντρον τὸ Δ,
 καὶ εἰλήφθω ἐπὶ τὰς περιφερείας αὐτοῦ τυχόντα
 450

TRIGONOMETRY

being produced to it. For, again, since AH is parallel to EZ,

$$\Gamma E : EA = \Gamma Z : ZH. \quad [\text{Eucl. vi. 2}]$$

But, an external straight line ZΔ having been taken,

$$\Gamma Z : ZH = (\Gamma Z : Z\Delta)(\Delta Z : ZH);$$

and $\Delta Z : ZH = \Delta B : BA$,

by reason of BA and ZH being drawn to meet the parallels AH and ZB;

$$\therefore \Gamma Z : ZH = (\Gamma Z : \Delta Z)(\Delta B : BA).$$

But $\Gamma Z : ZH = \Gamma E : EA$; [*supra*]

$$\text{and } \therefore \Gamma E : EA = (\Gamma Z : \Delta Z)(\Delta B : BA); \quad (2)$$

which was to be proved.

Again, let ABΓ be a circle with centre Δ, and let

there be taken on its circumference any three points

τρία σημεία τὰ Α, Β, Γ, ὥστε ἑκατέραν τῶν ΑΒ, ΒΓ περιφερειῶν ἐλάσσονα εἶναι ἡμικυκλίου· καὶ ἐπὶ τῶν ἐξῆς δὲ λαμβανομένων περιφερειῶν τὸ ὁμοιον ὑπακουέσθω· καὶ ἐπεξεύχθωσαν αἱ ΑΓ καὶ ΔΕΒ. λέγω, ὅτι ἐστίν, ὡς ἡ ὑπὸ τὴν διπλὴν τῆς ΑΒ περιφερείας πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΒΓ, οὕτως ἡ ΑΕ εὐθεῖα πρὸς τὴν ΕΓ εὐθείαν.

Ἦχθωσαν γὰρ κάθετοι ἀπὸ τῶν Α καὶ Γ σημείων ἐπὶ τὴν ΔΒ ἢ τε ΑΖ καὶ ἡ ΓΗ. ἐπεὶ παράλληλός ἐστιν ἡ ΑΖ τῇ ΓΗ, καὶ διηκται εἰς αὐτὰς εὐθεῖα ἡ ΑΕΓ, ἔστιν, ὡς ἡ ΑΖ πρὸς τὴν ΓΗ, οὕτως ἡ ΑΕ πρὸς ΕΓ. ἀλλ' ὁ αὐτός ἐστιν λόγος ὁ τῆς ΑΖ πρὸς ΓΗ καὶ τῆς ὑπὸ τὴν διπλὴν τῆς ΑΒ περιφερείας πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΒΓ· ἡμίσεια γὰρ ἑκατέρα ἑκατέρας· καὶ ὁ τῆς ΑΕ ἄρα πρὸς ΕΓ λόγος ὁ αὐτός ἐστιν τῷ τῆς ὑπὸ τὴν διπλὴν τῆς ΑΒ πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΒΓ· ὅπερ ἔδει δεῖξαι.

Παρακολουθεῖ δ' αὐτόθεν, ὅτι, καὶ δοθῶσιν ἡ τε ΑΓ ὅλη περιφέρεια καὶ ὁ λόγος ὁ τῆς ὑπὸ τὴν διπλὴν τῆς ΑΒ πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΒΓ, δοθήσεται καὶ ἑκατέρα τῶν ΑΒ καὶ ΒΓ περιφερειῶν. ἐκτεθείσης γὰρ τῆς αὐτῆς καταγραφῆς ἐπεξεύχθω ἡ ΑΔ, καὶ ἦχθω ἀπὸ τοῦ Δ κάθετος ἐπὶ τὴν ΑΕΓ ἢ ΔΖ. ὅτι μὲν οὖν τῆς ΑΓ περι-

TRIGONOMETRY

A, B, Γ , in such a manner that each of the arcs AB, B Γ is less than a semicircle ; and upon the arcs taken in succession let there be a similar relationship ; and let A Γ be joined and Δ EB. I say that

the chord subtended by double of the arc AB :

the chord subtended by double of the arc B Γ

$$[i.e., \sin AB : \sin B\Gamma^a] = AE : E\Gamma.$$

For let perpendiculars AZ and Γ H be drawn from the points A and Γ to Δ B. Since AZ is parallel to Γ H, and the straight line AEF has been drawn to meet them,

$$AZ : \Gamma H = AE : E\Gamma. \quad [\text{Eucl. vi. 4}]$$

But $AZ : \Gamma H$ = the chord subtended by double of the arc AB :

the chord subtended by double of the arc B Γ ,

for each term is half of the corresponding term ;

and therefore

$AE : E\Gamma$ = the chord subtended by double of the arc AB :

the chord subtended by double of the arc B Γ (3)

$$[= \sin AB : \sin B\Gamma],$$

which was to be proved.

It follows immediately that, if the whole arc A Γ be given, and the ratio of the chord subtended by double of the arc AB to the chord subtended by double of the arc B Γ [*i.e.* $\sin AB : \sin B\Gamma$], each of the arcs AB and B Γ will also be given. For let the same diagram be set out, and let A Δ be joined, and from Δ let Δ Z be drawn perpendicular to AEF. If the arc

^a *v. supra*, p. 420 n. a.

φερείας δοθείσης ἥ τε ὑπὸ $\Delta\Delta Z$ γωνία τὴν ἡμίσειαν αὐτῆς ὑποτείνουσα δεδομένη ἔσται καὶ ὅλον τὸ $\Delta\Delta Z$ τρίγωνον, δηλον· ἐπεὶ δὲ τῆς $\Delta\Gamma$

εὐθείας ὅλης δεδομένης ὑπόκειται καὶ ὁ τῆς ΔE πρὸς $E\Gamma$ λόγος ὁ αὐτὸς ὡν τῶ τῆς ὑπὸ τὴν διπλὴν τῆς ΔB πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς $B\Gamma$, ἥ τε ΔE ἔσται δοθείσα καὶ λοιπὴ ἡ $Z E$. καὶ διὰ τοῦτο καὶ τῆς ΔZ δεδομένης δοθήσεται καὶ ἡ τε ὑπὸ $E\Delta Z$ γωνία τοῦ $E\Delta Z$ ὀρθογωνίου καὶ ὅλη ἡ ὑπὸ $\Delta\Delta B$. ὥστε καὶ ἡ τε ΔB περιφέρεια δοθήσεται καὶ λοιπὴ ἡ $B\Gamma$. ὅπερ ἔδει δεῖξαι.

Πάλιν ἔστω κύκλος ὁ $\Delta B\Gamma$ περὶ κέντρον τὸ Δ , καὶ ἐπὶ τῆς περιφερείας αὐτοῦ εἰλήφθω τρία σημεῖα τὰ A, B, Γ , ὥστε ἑκατέραν τῶν $\Delta B, \Delta\Gamma$ περιφερειῶν ἐλάσσονα εἶναι ἡμικυκλίου· καὶ ἐπὶ

.TRIGONOMETRY

$A\Gamma$ is given, it is then clear that the angle $A\Delta Z$, subtending half the same arc, will also be given and therefore the whole triangle $A\Delta Z$; and since the whole chord $A\Gamma$ is given, and by hypothesis

$AE : E\Gamma = \text{the chord subtended by double of the arc } AB :$

$\text{the chord subtended by double of the arc } B\Gamma,$

$[i.e. = \sin AB : \sin B\Gamma],$

therefore AE will be given [Eucl. *Dat.* 7], and the remainder ZE . And for this reason, ΔZ also being given, the angle $E\Delta Z$ will be given in the right-angled triangle $E\Delta Z$, and [therefore] the whole angle $A\Delta B$; therefore the arc AB will be given and also the remainder $B\Gamma$; which was to be proved.

Again, let $AB\Gamma$ be a circle about centre Δ , and let

three points A, B, Γ be taken on its circumference so that each of the arcs $AB, A\Gamma$ is less than a semicircle ;

τῶν ἐξῆς δὲ λαμβανομένων περιφερειῶν τὸ ὅμοιον ὑπακουέσθω· καὶ ἐπιζευχθεῖσαι ἢ τε ΔΑ καὶ ἡ ΓΒ ἐκβεβλήσθωσαν καὶ συμπιπτέτωσαν κατὰ τὸ Ε σημεῖον. λέγω, ὅτι ἐστίν, ὡς ἡ ὑπὸ τὴν διπλὴν τῆς ΓΑ περιφερείας πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΑΒ, οὕτως ἡ ΓΕ εὐθεῖα πρὸς τὴν ΒΕ.

Ὅμοίως γὰρ τῷ προτέρῳ λημματίῳ, ἐὰν ἀπὸ τῶν Β καὶ Γ ἀγάγωμεν καθέτους ἐπὶ τὴν ΔΑ τὴν τε ΒΖ καὶ τὴν ΓΗ, ἔσται διὰ τὸ παραλλήλους αὐτὰς εἶναι, ὥς ἡ ΓΗ πρὸς τὴν ΒΖ, οὕτως ἡ ΓΕ πρὸς τὴν ΕΒ· ὥστε καί, ὥς ἡ ὑπὸ τὴν διπλὴν τῆς ΓΑ πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΑΒ, οὕτως ἡ ΓΕ πρὸς τὴν ΕΒ· ὅπερ ἔδει δεῖξαι.

Καὶ ἐνταῦθα δὲ αὐτόθεν παρακολουθεῖ, διότι, καὶ ἡ ΓΒ περιφέρεια μόνῃ δοθῇ, καὶ ὁ λόγος ὁ τῆς ὑπὸ τὴν διπλὴν τῆς ΓΑ πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΑΒ δοθῇ, καὶ ἡ ΑΒ περιφέρεια δοθῇ-
σεται. πάλιν γὰρ ἐπὶ τῆς ὁμοίας καταγραφῆς ἐπιζευχθείσης τῆς ΔΒ καὶ καθέτου ἀχθείσης ἐπὶ

τὴν ΒΓ τῆς ΔΖ ἥ μὲν ὑπὸ ΒΔΖ γωνία τὴν ἡμίσειαν ὑποτείνουσα τῆς ΒΓ περιφέρειας ἔσται

• TRIGONOMETRY

and upon the arcs taken in succession let there be a similar relationship; and let ΔA be joined and let ΓB be produced so as to meet it at the point E . I say that

the chord subtended by double of the arc ΓA :

the chord subtended by double of the arc AB

[i.e., $\sin \Gamma A : \sin AB$] = $\Gamma E : BE$.

For, as in the previous lemma, if from B and Γ we draw BZ and ΓH perpendicular to ΔA , then, by reason of the fact that they are parallel,

$$\Gamma H : BZ = \Gamma E : EB. \quad [\text{Eucl. vi. 4}]$$

\therefore the chord subtended by double of the arc ΓA :

the chord subtended by double of the arc AB

[i.e., $\sin \Gamma A : \sin AB$] = $\Gamma E : EB$; . . . (4)

which was to be proved.

And thence it immediately follows why, if the arc ΓB alone be given, and the ratio of the chord subtended by double of the arc ΓA to the chord subtended by double of the arc AB [i.e., $\sin \Gamma A : \sin AB$], the arc AB will also be given. For again, in a similar diagram let ΔB be joined and let ΔZ be drawn perpendicular to $B\Gamma$; then the angle $B\Delta Z$ subtended by half the arc $B\Gamma$ will be given; and therefore the

δεδομένη· καὶ ὅλον ἄρα τὸ ΒΔΖ ὀρθογώνιον. ἔπει δὲ καὶ ὁ τε τῆς ΓΕ πρὸς τὴν ΕΒ λόγος δέδοται καὶ ἔτι ἡ ΓΒ εὐθεία, δοθήσεται καὶ ἡ τε ΕΒ καὶ ἔτι ὅλη ἡ ΕΒΖ· ὥστε καί, ἔπει ἡ ΔΖ δέδοται, δοθήσεται καὶ ἡ τε ὑπὸ ΕΔΖ γωνία τοῦ αὐτοῦ ὀρθογωνίου καὶ λοιπὴ ἡ ὑπὸ ΕΔΒ. ὥστε καὶ ἡ ΑΒ περιφέρεια ἔσται δεδομένη.

(ii.) *The Theorem*

Ibid. 74. 9-76. 9

Τούτων προληφθέντων γεγράφθωσαν ἐπὶ σφαιρικῆς ἐπιφανείας μεγίστων κύκλων περιφέρειαι, ὥστε εἰς δύο τὰς ΑΒ καὶ ΑΓ δύο γραφεῖσας τὰς ΒΕ καὶ ΓΔ τέμνειν ἀλλήλας κατὰ τὸ Ζ σημεῖον· ἔστω δὲ ἐκάστη αὐτῶν ἐλάσσων ἡμικυκλίου· τὸ δὲ αὐτὸ καὶ ἐπὶ πασῶν τῶν καταγραφῶν ὑπακουέσθω.

Λέγω δὴ, ὅτι ὁ τῆς ὑπὸ τὴν διπλὴν τῆς ΓΕ περιφερείας πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΕΑ λόγος συνήπται ἔκ τε τοῦ τῆς ὑπὸ τὴν διπλὴν τῆς ΓΖ πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΖΔ καὶ τοῦ τῆς ὑπὸ τὴν διπλὴν τῆς ΔΒ πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΒΑ.

Εἰλήφθω γὰρ τὸ κέντρον τῆς σφαίρας καὶ ἔστω τὸ Η, καὶ ἤχθωσαν ἀπὸ τοῦ Η ἐπὶ τὰς Β, Ζ, Ε τομὰς τῶν κύκλων ἡ τε ΗΒ καὶ ἡ ΗΖ καὶ ἡ ΗΕ, καὶ ἐπιζευχθεῖσα ἡ ΑΔ ἐκβεβλήσθω καὶ συμπίπτέτω τῇ ΗΒ ἐκβληθείσῃ καὶ αὐτῇ κατὰ τὸ Θ σημεῖον, ὁμοίως δὲ ἐπιζευχθεῖσαι αἱ ΔΓ καὶ ΑΓ τεμνέτωσαν τὰς ΗΖ καὶ ΗΕ κατὰ τὸ Κ καὶ Λ

. TRIGONOMETRY

whole of the right-angled triangle $B\Delta Z$. But since the ratio $\Gamma E : EB$ is given and also the chord ΓB , therefore EB will also be given and, further, the whole [straight line] EBZ ; therefore, since ΔZ is given, the angle $E\Delta Z$ in the same right-angled triangle will be given, and the remainder $E\Delta B$. Therefore the arc AB will be given.

(ii.) *The Theorem*

Ibid. 74. 9-76. 9

These things having first been grasped, let there be described on the surface of a sphere arcs of great circles such that the two arcs $B\Gamma$ and $\Gamma\Delta$ will meet the two arcs AB and $A\Gamma$ and will cut one another at the point Z ; let each of them be less than a semi-circle; and let this hold for all the diagrams.

Now I say that the ratio of the chord subtended by double of the arc ΓE to the chord subtended by double of the arc EA is compounded of (a) the ratio of the chord subtended by double of the arc ΓZ to the chord subtended by double of the arc $Z\Delta$, and (b) the ratio of the chord subtended by double of the arc ΔB to the chord subtended by double of the arc BA ,

$$\left[i.e., \frac{\sin \Gamma E}{\sin EA} = \frac{\sin \Gamma Z}{\sin Z\Delta} \cdot \frac{\sin \Delta B}{\sin BA} \right].$$

For let the centre of the sphere be taken, and let it be H , and from H let HB and HZ and HE be drawn to B , Z , E , the points of intersection of the circles, and let $A\Delta$ be joined and produced, and let it meet HB produced at the point Θ , and similarly let $\Delta\Gamma$ and $A\Gamma$ be joined and cut HZ and HE at K and the point

σημείον· ἐπὶ μιᾷ δὴ γίνεται εὐθείας τὰ Θ , K , Λ
σημεῖα διὰ τὸ ἐν δυσὶν ἅμα εἶναι ἐπιπέδοις τῷ τε
τοῦ $ΑΓΔ$ τριγώνου καὶ τῷ τοῦ BZE κύκλου, ἥτις

ἐπιζευχθεῖσα ποιεῖ εἰς δύο εὐθείας τὰς ΘA καὶ
 ΓA διηγμένας τὰς $\Theta \Lambda$ καὶ $\Gamma \Delta$ τεμνούσας ἀλλήλας
κατὰ τὸ K σημείον· ὁ ἄρα τῆς $\Gamma \Lambda$ πρὸς ΛA λόγος
συνήπται ἐκ τε τοῦ τῆς ΓK πρὸς $K \Delta$ καὶ τοῦ τῆς

οὕτως ἡ ὑπὸ τὴν διπλὴν τῆς ΓE πρὸς τὴν ὑπὸ τὴν
διπλὴν τῆς $E A$ περιφερείας, ὥς δὲ ἡ ΓK πρὸς
 $K \Delta$, οὕτως ἡ ὑπὸ τὴν διπλὴν τῆς ΓZ περιφερείας
πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς $Z \Delta$, ὥς δὲ ἡ $\Theta \Delta$

• TRIGONOMETRY

Λ ; then the points Θ , K , Λ will lie on one straight line because they lie simultaneously in two planes, that of the triangle $A\Gamma\Delta$ and that of the circle BZE , and therefore we have straight lines $\Theta\Lambda$ and $\Gamma\Delta$ meeting the two straight lines ΘA and ΓA and cutting one another at the point K ; therefore

$$\Gamma\Lambda : \Lambda A = (\Gamma K : K\Delta)(\Delta\Theta : \Theta A). \quad [\text{by (2)}]$$

But $\Gamma\Lambda : \Lambda A =$ the chord subtended by double of
the arc ΓE :

the chord subtended by double
of the arc EA

$$[\text{i.e., } \sin \Gamma E : \sin EA],$$

while $\Gamma K : K\Delta =$ the chord subtended by double of
the arc ΓZ :

the chord subtended by double of
the arc $Z\Delta$ [by (3)]

$$[\text{i.e., } \sin \Gamma Z : \sin Z\Delta],$$

πρὸς ΘΑ, οὕτως ἡ ὑπὸ τὴν διπλὴν τῆς ΔΒ περι-
 φερείας πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΒΑ· καὶ ὁ
 λόγος ἄρα ὁ τῆς ὑπὸ τὴν διπλὴν τῆς ΓΕ πρὸς τὴν
 ὑπὸ τὴν διπλὴν τῆς ΕΑ συνήπται ἔκ τε τοῦ τῆς
 ὑπὸ τὴν διπλὴν τῆς ΓΖ πρὸς τὴν ὑπὸ τὴν διπλὴν
 τῆς ΖΔ καὶ τοῦ τῆς ὑπὸ τὴν διπλὴν τῆς ΔΒ πρὸς
 τὴν ὑπὸ τὴν διπλὴν τῆς ΒΑ.

Κατὰ τὰ αὐτὰ δὴ καὶ ὥσπερ ἐπὶ τῆς ἐπιπέδου
 καταγραφῆς τῶν εὐθειῶν δείκνυται, ὅτι καὶ ὁ τῆς
 ὑπὸ τὴν διπλὴν τῆς ΓΑ πρὸς τὴν ὑπὸ τὴν διπλὴν
 τῆς ΕΑ λόγος συνήπται ἔκ τε τοῦ τῆς ὑπὸ τὴν
 διπλὴν τῆς ΓΔ πρὸς τὴν ὑπὸ τὴν διπλὴν τῆς ΔΖ
 καὶ τοῦ τῆς ὑπὸ τὴν διπλὴν τῆς ΖΒ πρὸς τὴν ὑπὸ
 τὴν διπλὴν τῆς ΒΕ· ἅπερ προέκειτο δεῖξαι.

^a From the Arabic version, it is known that "Menelaus's Theorem" was the first proposition in Book iii. of his *Sphaerica*, and several interesting deductions follow.

. TRIGONOMETRY

and $\Theta\Delta : \Theta\Delta =$ the chord subtended by double of the arc ΔB :

the chord subtended by double of
the arc ΔA [by (4)]

[i.e., $\sin \Delta B : \sin \Delta A$],

and therefore the ratio of the chord subtended by double of the arc ΓE to the chord subtended by double of the arc EA is compounded of (a) the ratio of the chord subtended by double of the arc ΓZ to the chord subtended by double of the arc $Z\Delta$, and (b) the ratio of the chord subtended by double of the arc ΔB to the chord subtended by double of the arc ΔA ,

$$\left[\text{i.e., } \frac{\sin \Gamma E}{\sin EA} = \frac{\sin \Gamma Z}{\sin Z\Delta} \cdot \frac{\sin \Delta B}{\sin \Delta A} \right].$$

Now with the same premises, and as in the case of the straight lines in the plane diagram [by (1)], it is shown that the ratio of the chord subtended by double of the arc ΓA to the chord subtended by double of the arc EA is compounded of (a) the ratio of the chord subtended by double of the arc $\Gamma \Delta$ to the chord subtended by double of the arc ΔZ , and (b) the ratio of the chord subtended by double of the arc ZB to the chord subtended by double of the chord BE ,

$$\left[\text{i.e., } \frac{\sin \Gamma A}{\sin EA} = \frac{\sin \Gamma \Delta}{\sin \Delta Z} \cdot \frac{\sin ZB}{\sin BE} \right];$$

which was set to be proved.^a

(a) DEFINITIONS

Heron, *Deff.*, ed. Heiberg (Heron iv.) 14. 1-24

Καὶ τὰ μὲν πρὸ τῆς γεωμετρικῆς στοιχειώσεως τεχνολογούμενα ὑπογράφων σοι καὶ ὑποτυπούμενος, ὡς ἔχει μάλιστα συντόμως, Διονύσιε λαμπρότατε, τήν τε ἀρχὴν καὶ τὴν ὅλην σύνταξιν ποιήσομαι κατὰ τὴν τοῦ Εὐκλείδου τοῦ Στοιχειωτοῦ τῆς ἐν γεωμετρίᾳ θεωρίας διδασκαλίαν· οἷμα γὰρ οὕτως οὐ μόνον τὰς ἐκείνου πραγματείας

^a The problem of Heron's date is one of the most disputed questions in the history of Greek mathematics. The only details certainly known are that he lived after Apollonius whom he quotes, and before Pappus, who cites him, say between 150 B.C. and A.D. 250. Many scraps of evidence have been thrown into the dispute, including the passage here first cited; for it is argued that the title *λαμπρότατος* corresponds to the Latin *clarissimus*, which was not in common use in the third century A.D. Both Heiberg (*Heron* vol. v. p. ix) and Heath (*H.G.M.* ii. 306) place him, however in the third century A.D., only a little earlier than Pappus.

The chief works of Heron are now definitively published in five volumes of the Teubner series. Perhaps the best known are his *Pneumatica* and the *Automata*, in which he shows how to use the force of compressed air, water or steam; they are of great interest in the history of physics, and have led some to describe Heron as "the father of the turbine," but

XXII. MENSURATION : HERON OF ALEXANDRIA "

(a) DEFINITIONS

Heron, *Definitions*, ed. Heiberg (Heron iv.) 14. 1-24

IN setting out for you as briefly as possible, O most excellent Dionysius, a sketch of the technical terms premised in the elements of geometry, I shall take as my starting point, and shall base my whole arrangement upon, the teaching of Euclid, the writer of the elements of theoretical geometry ; for in this way I think I shall give you a good general understanding,

as they have no mathematical interest they cannot be noticed here. Heron also wrote a *Beloposica* on the construction of engines of war, and a *Mechanics*, which has survived in Arabic and in a few fragments of the Greek.

In geometry, Heron's elaborate collection of *Definitions* has survived, but his *Commentary on Euclid's Elements* is known only from extracts preserved by Proclus and an-Nairizi, the Arabic commentator. In mensuration there are extant the *Metrica*, *Geometrica*, *Stereometrica*, *Geodaesia*, *Mensurae* and *Liber Geponicus*. The *Metrica*, discovered in a Constantinople ms. in 1896 by R. Schöne and edited by his son H. Schöne, seems to have preserved its original form more closely than the others, and will be relied on here in preference to them. Heron's *Dicentra*, describing an instrument of the nature of a theodolite and its application to surveying, is also extant and will be cited here.

For a full list of Heron's many works, v. Heath, *H.G.M.* ii. 808-810.

εὐσυνόπτους ἔσεσθαι σοι, ἀλλὰ καὶ πλείστας ἄλλας τῶν εἰς γεωμετρίαν ἀνηκόντων. ἄρξομαι τοίνυν ἀπὸ σημείου.

^a The first definition is that of Euclid i. Def. 1, the third in effect that of Plato, who defined a point as ἀρχὴ γραμμῆς (Aristot. *Metaph.* 992 a 20); the second is reminiscent of Nicomachus, *Arith. Intro.* ii. 7. 1, v. vol. i. pp. 86-89.

MENSURATION: HERON OF ALEXANDRIA

not only of Euclid's works, but of many others pertaining to geometry. I shall begin, then, with the point.

1. A *point* is that which has no parts, or an extremity without extension, or the extremity of a line,^a and, being both without parts and without magnitude, it can be grasped by the understanding only. It is said to have the same character as the moment in time or the unit having position.^b It is the same as the unit in its fundamental nature, for they are both indivisible and incorporeal and without parts, but in relation to surface and position they differ; for the unit is the beginning of number, while the point is the beginning of geometrical being—but a beginning by way of setting out only, not as a part of a line, in the way that the unit is a part of number—and is prior to geometrical being in conception; for when a point moves, or rather is conceived in motion, a line is conceived, and in this way a point is the beginning of a line and a surface is the beginning of a solid body.

Ibid. 60. 22–62. 9

97. A *spire* is generated when a circle revolves and returns to its original position in such a manner that its centre traces a circle, the original circle remaining at right angles to the plane of this circle; this same curve is also called a *ring*. A spire is *open* when there is a gap, *continuous* when it touches at one point, and *self-crossing* when the revolving circle cuts itself.

^b The Pythagorean definition of a point: v. Proclus, in *Eucl.* i., ed. Friedlein 95. 22. Proclus's whole comment is worth reading, and among modern writers there is a full discussion in Heath, *The Thirteen Books of Euclid's Elements*, vol. i. pp. 155–158.

Certain special curves are generated by sections of these spires. But the *square rings* are prismatic sections of cylinders ; various other kinds of prismatic sections are formed from spheres and *mixed* surfaces.^a

(b) MEASUREMENT OF AREAS AND VOLUMES

(i.) *Area of a Triangle Given the Sides*

Heron, *Metrica* i. 8, ed. H. Schöne (Heron iii.) 18. 12-24. 21

There is a general method for finding, without drawing a perpendicular, the area of any triangle whose three sides are given. For example, let the sides of the triangle be 7, 8 and 9. Add together 7, 8 and 9 ; the result is 24. Take half of this, which gives 12. Take away 7 ; the remainder is 5. Again, from 12 take away 8 ; the remainder is 4. And again 9 ; the remainder is 3. Multiply 12 by 5 ; the result is 60. Multiply this by 4 ; the result is 240. Multiply this by 3 ; the result is 720. Take the square root of this and it will be the area of the triangle. Since 720 has not a rational square root, we shall make a close approximation to the root in this manner. Since the square nearest to 720 is 729, having a root 27, divide 27 into 720 ; the result is $26\frac{5}{9}$; add 27 ; the result is $53\frac{5}{9}$. Take half of this ; the result is $26\frac{1}{2} + \frac{1}{3} (= 26\frac{5}{6})$. Therefore the square root of 720 will be very nearly $26\frac{5}{6}$. For $26\frac{5}{6}$ multiplied by itself gives $720\frac{1}{18}$; so that the difference is $\frac{1}{18}$. If we wish to make the difference less than $\frac{1}{18}$,

^a The passage should be read in conjunction with those from Proclus cited *supra*, pp. 360-365 ; note the slight difference in terminology—*self-crossing* for *interlaced*.

ἐν ἐλάσσονι μορίῳ τοῦ $\lambda\varsigma'$ τὴν διαφορὰν γίνεσθαι, ἀντὶ τοῦ $\overline{\psi\kappa\theta}$ τάξομεν τὰ νῦν εὑρεθέντα $\overline{\psi\kappa}$ καὶ $\lambda\varsigma'$, καὶ ταῦτα ποιήσαντες εὑρήσομεν πολλῶ ἐλάττονα (τοῦ)¹ $\lambda\varsigma'$ τὴν διαφορὰν γιγνομένην.

Ἡ δὲ γεωμετρικὴ τούτου ἀπόδειξις ἐστὶν ἡδε· τριγώνου δοθεισῶν τῶν πλευρῶν εὑρεῖν τὸ ἐμβαδόν. δυνατὸν μὲν οὖν ἐστὶν ἀγαγόντα[s]² μίαν κάθετον καὶ πορισάμενον αὐτῆς τὸ μέγεθος εὑρεῖν τοῦ τριγώνου τὸ ἐμβαδόν, δεόν δὲ ἔστω χωρὶς τῆς καθέτου τὸ ἐμβαδὸν πορίσασθαι.

Ἐστω τὸ δοθὲν τρίγωνον τὸ ABΓ καὶ ἔστω ἐκάστη τῶν AB, BΓ, ΓA δοθεῖσα· εὑρεῖν τὸ ἐμβα-

¹ τοῦ add. Heiberg.

² ἀγαγόντα[s] corr. H. Schöne.

^a If a non-square number A is equal to $a^2 \pm b$, Heron's method gives as a first approximation to \sqrt{A} ,

$$\alpha_1 = \frac{1}{2} \left(a + \frac{A}{a} \right),$$

and as a second approximation,

$$\alpha_2 = \frac{1}{2} \left(\alpha_1 + \frac{A}{\alpha_1} \right).$$

An equivalent formula is used by Rhahdas (v. vol. i. p. 30 n. b) and by a fourteenth century Calabrian monk Barlaam, who wrote in Greek and who indicated that the process could be continued indefinitely. Several modern writers have used the formula to account for Archimedes' approximations to $\sqrt{3}$ (v. vol. i. p. 322 n. a).

^b Heron had previously shown how to do this.

MENSURATION: HERON OF ALEXANDRIA

instead of 729 we shall take the number now found, $720\frac{1}{38}$, and by the same method we shall find an approximation differing by much less than $\frac{1}{38}$.^a

The geometrical proof of this is as follows : *In a triangle whose sides are given to find the area.* Now it is possible to find the area of the triangle by drawing one perpendicular and calculating its magnitude,^b but let it be required to calculate the area without the perpendicular.

Let $\triangle ABC$ be the given triangle, and let each of

AB, BΓ, ΓA be given; to find the area. Let the

δόν. ἐγγεγράφθω εἰς τὸ τρίγωνον κύκλος ὁ ΔΕΖ, οὗ κέντρον ἔστω τὸ Η, καὶ ἐπεζεύχθωσαν αἱ ΑΗ, ΒΗ, ΓΗ, ΔΗ, ΕΗ, ΖΗ. τὸ μὲν ἄρα ὑπὸ ΒΓ, ΕΗ διπλάσιόν ἐστι τοῦ ΒΗΓ τριγώνου, τὸ δὲ ὑπὸ ΓΑ, ΖΗ τοῦ ΑΓΗ τριγώνου, (τὸ δὲ ὑπὸ ΑΒ, ΔΗ τοῦ ΑΒΗ τριγώνου)¹. τὸ ἄρα ὑπὸ τῆς περιμέτρου τοῦ ΑΒΓ τριγώνου καὶ τῆς ΕΗ, τουτέστι τῆς ἐκ τοῦ κέντρου τοῦ ΔΕΖ κύκλου, διπλάσιόν ἐστι τοῦ ΑΒΓ τριγώνου. ἐκβεβλήσθω ἡ ΓΒ, καὶ τῇ ΑΔ ἴση κείσθω ἡ ΒΘ· ἡ ἄρα ΓΒΘ ἡμίσειά ἐστι τῆς περιμέτρου τοῦ ΑΒΓ τριγώνου διὰ τὸ ἴσην εἶναι τὴν μὲν ΑΔ τῇ ΑΖ, τὴν δὲ ΔΒ τῇ ΒΕ, τὴν δὲ ΖΓ τῇ ΓΕ. τὸ ἄρα ὑπὸ τῶν ΓΘ, ΕΗ ἴσον ἐστὶ τῷ ΑΒΓ τριγώνῳ. ἀλλὰ τὸ ὑπὸ τῶν ΓΘ, ΕΗ πλευρά ἐστὶν τοῦ ἀπὸ τῆς ΓΘ ἐπὶ τὸ ἀπὸ τῆς ΕΗ· ἔσται ἄρα τοῦ ΑΒΓ τριγώνου τὸ ἐμβαδὸν ἐφ' ἑαυτὸ γενόμενον ἴσον τῷ ἀπὸ τῆς ΘΓ ἐπὶ τὸ ἀπὸ τῆς ΕΗ. ἤχθω τῇ μὲν ΓΗ πρὸς ὀρθὰς ἡ ΗΛ, τῇ δὲ ΓΒ ἡ ΒΛ, καὶ ἐπεζεύχθω ἡ ΓΛ. ἐπεὶ οὖν ὀρθὴ ἐστὶν ἑκατέρα τῶν ὑπὸ ΓΗΛ, ΓΒΛ, ἐν κύκλῳ ἄρα ἐστὶ τὸ ΓΗΒΛ τετράπλευρον· αἱ ἄρα ὑπὸ ΓΗΒ, ΓΛΒ δυσὶν ὀρθαῖς εἰσὶν ἴσαι. εἰσὶν δὲ καὶ αἱ ὑπὸ ΓΗΒ, ΑΗΔ δυσὶν ὀρθαῖς ἴσαι διὰ τὸ δίχα τετμησθαι τὰς πρὸς τῷ Η γωνίας ταῖς ΑΗ, ΒΗ, ΓΗ καὶ ἴσας εἶναι τὰς ὑπὸ τῶν ΓΗΒ, ΑΗΔ ταῖς ὑπὸ τῶν ΑΗΓ, ΔΗΒ καὶ τὰς πάσας τέτρασιν ὀρθαῖς ἴσας εἶναι· ἴση ἄρα ἐστὶν ἡ ὑπὸ ΑΗΔ τῇ ὑπὸ ΓΛΒ. ἔστι δὲ καὶ ὀρθὴ ἡ ὑπὸ ΑΔΗ ὀρθῇ τῇ ὑπὸ ΓΒΛ ἴση· ὁμοιον ἄρα ἐστὶ τὸ ΑΗΔ τρίγωνον τῷ ΓΒΛ τριγώνῳ. ὥς ἄρα ἡ ΒΓ πρὸς

¹ τὸ δὲ . . . τριγώνου: these words, along with several
474

MENSURATION : HERON OF ALEXANDRIA

circle ΔEZ be inscribed in the triangle with centre H [Eucl. iv. 4], and let $AH, BH, \Gamma H, \Delta H, EH, ZH$ be joined. Then

$$B\Gamma \cdot EH = 2 \cdot \text{triangle } BHT, \quad [\text{Eucl. i. 41}]$$

$$\Gamma A \cdot ZH = 2 \cdot \text{triangle } AHT, \quad [\textit{ibid.}]$$

$$AB \cdot \Delta H = 2 \cdot \text{triangle } ABH. \quad [\textit{ibid.}]$$

Therefore the rectangle contained by the perimeter of the triangle $AB\Gamma$ and EH , that is the radius of the circle ΔEZ , is double of the triangle $AB\Gamma$. Let ΓB be produced and let $B\Theta$ be placed equal to $A\Delta$; then $\Gamma B\Theta$ is half of the perimeter of the triangle $AB\Gamma$ because $A\Delta = AZ, \Delta B = BE, Z\Gamma = \Gamma E$ [by Eucl. iii. 17]. Therefore

$$\Gamma\Theta \cdot EH = \text{triangle } AB\Gamma. \quad [\textit{ibid.}]$$

$$\text{But} \quad \Gamma\Theta \cdot EH = \sqrt{\Gamma\Theta^2 \cdot EH^2};$$

$$\text{therefore} \quad (\text{triangle } AB\Gamma)^2 = \Gamma\Theta^2 \cdot EH^2.$$

Let HA be drawn perpendicular to ΓH and BA perpendicular to ΓB , and let ΓA be joined. Then since each of the angles $\Gamma HA, \Gamma BA$ is right, a circle can be described about the quadrilateral ΓHBA [by Eucl. iii. 31]; therefore the angles $\Gamma HB, \Gamma AB$ are together equal to two right angles [Eucl. iii. 22]. But the angles $\Gamma HB, AHA$ are together equal to two right angles because the angles at H are bisected by $AH, BH, \Gamma H$ and the angles $\Gamma HB, AHA$ together with $AHT, \Delta HB$ are equal to four right angles; therefore the angle AHA is equal to the angle ΓAB . But the right angle $A\Delta H$ is equal to the right angle ΓBA ; therefore the triangle AHA is similar to the triangle ΓBA .

other obvious corrections not specified in this edition, were rightly added to the text by a fifteenth-century scribe.

ΒΛ, ἢ ΑΔ πρὸς ΔΗ, τουτέστιν ἢ ΒΘ πρὸς ΕΗ, καὶ ἐναλλάξ, ὡς ἢ ΓΒ πρὸς ΒΘ, ἢ ΒΛ πρὸς ΕΗ, τουτέστιν ἢ ΒΚ πρὸς ΚΕ διὰ τὸ παράλληλον εἶναι τὴν ΒΛ τῇ ΕΗ, καὶ συνθέντι, ὡς ἢ ΓΘ πρὸς ΒΘ, οὕτως ἢ ΒΕ πρὸς ΕΚ· ὥστε καὶ ὡς τὸ ἀπὸ τῆς ΓΘ πρὸς τὸ ὑπὸ τῶν ΓΘ, ΘΒ, οὕτως τὸ ὑπὸ ΒΕΓ πρὸς τὸ ὑπὸ ΓΕΚ, τουτέστι πρὸς τὸ ἀπὸ ΕΗ· ἐν ὀρθογωνίῳ γὰρ ἀπὸ τῆς ὀρθῆς ἐπὶ τὴν βάσιν κάθετος ἤκται ἢ ΕΗ· ὥστε τὸ ἀπὸ τῆς ΓΘ ἐπὶ τὸ ἀπὸ τῆς ΕΗ, οὗ πλευρὰ ἦν τὸ ἐμβαδὸν τοῦ ΑΒΓ τριγώνου, ἴσον ἔσται τῷ ὑπὸ ΓΘΒ ἐπὶ τὸ ὑπὸ ΓΕΒ. καὶ ἔστι δοθεῖσα ἐκάστη τῶν ΓΘ, ΘΒ, ΒΕ, ΓΕ· ἢ μὲν γὰρ ΓΘ ἡμίσειά ἐστι τῆς περιμέτρου τοῦ ΑΒΓ τριγώνου, ἢ δὲ ΒΘ ἢ ὑπεροχή, ἢ ὑπερέχει ἢ ἡμίσεια τῆς περιμέτρου τῆς ΓΒ, ἢ δὲ ΒΕ ἢ ὑπεροχή, ἢ ὑπερέχει ἢ ἡμίσεια τῆς περιμέτρου τῆς ΑΓ, ἢ δὲ ΕΓ ἢ ὑπεροχή, ἢ ὑπερέχει ἢ ἡμίσεια τῆς περιμέτρου τῆς ΑΒ, ἐπειδήπερ ἴση ἐστὶν ἢ μὲν ΕΓ τῇ ΓΖ, ἢ δὲ ΒΘ τῇ ΑΖ, ἐπεὶ καὶ τῇ ΑΔ ἐστὶν ἴση. δοθὲν ἄρα καὶ τὸ ἐμβαδὸν τοῦ ΑΒΓ τριγώνου.

Ἔστω γάρ τις ἐν ἐπιπέδῳ εὐθείᾳ ἢ ΑΒ καὶ δύο τυχόντα ἐπ' αὐτῆς σημεία. εἰλήφθω δὲ ΒΓΔΕ <κύκλος>¹ ὀρθὸς ὦν πρὸς τὸ ὑποκείμενον ἐπίπεδον, ἐν ᾧ ἐστὶν ἢ ΑΒ εὐθεία, καὶ μένοντος τοῦ Α

¹ κύκλος add. H. Schöne.

MENSURATION: HERON OF ALEXANDRIA

Therefore $BI' : BA = A\Delta : \Delta II$

$$= B\Theta : EH,$$

and *permutando*, $\Gamma B : B\Theta = BA : EH$

$$= BK : KE,$$

because BA is parallel to EH ,

and *componendo* $\Gamma\Theta : B\Theta = BE : EK$;

therefore $\Gamma\Theta^2 : \Gamma\Theta \cdot \Theta B = BE \cdot E\Gamma : \Gamma E \cdot EK$,

$$\text{i.e.} \quad = BE \cdot E\Gamma : EH^2,$$

for in a right-angled triangle EH has been drawn from the right angle perpendicular to the base; therefore $\Gamma\Theta^2 \cdot EH^2$, whose square root is the area of the triangle $AB\Gamma$, is equal to $(\Gamma\Theta \cdot \Theta B)(\Gamma E \cdot EB)$. And each of $\Gamma\Theta$, ΘB , BE , ΓE is given; for $\Gamma\Theta$ is half of the perimeter of the triangle $AB\Gamma$, while $B\Theta$ is the excess of half the perimeter over ΓB , BE is the excess of half the perimeter over AI' , and $E\Gamma$ is the excess of half the perimeter over AB , inasmuch as $E\Gamma = \Gamma Z$, $B\Theta = A\Delta = \Delta Z$. Therefore the area of the triangle $AB\Gamma$ is given.^a

(ii.) *Volume of a Spire*

Ibid. ii. 13, ed. H. Schöne (Heron iii.) 126. 10–130. 3

Let AB be any straight line in a plane and A, B any two points taken on it. Let the circle $B\Gamma\Delta E$ be taken perpendicular to the plane of the horizontal, in which lies the straight line AB , and, while the point

^a If the sides of the triangle are a, b, c , and $s = \frac{1}{2}(a + b + c)$, Heron's formula may be stated in the familiar terms,

$$\text{area of triangle} = \sqrt{s(s-a)(s-b)(s-c)}.$$

Heron also proves the formula in his *Dioptra* 30, but it is now known from Arabian sources to have been discovered by Archimedes.

σημείου περιφερέσθω κατὰ τὸ ἐπίπεδον ἡ AB , ἄχρι οὗ εἰς τὸ αὐτὸ ἀποκατασταθῇ συμπεριφερόμενου καὶ τοῦ $BΓΔΕ$ κύκλου ὀρθοῦ διαμένοντος πρὸς τὸ ὑποκείμενον ἐπίπεδον. ἀπογεννήσει ἄρα τινὰ ἐπιφάνειαν ἡ $BΓΔΕ$ περιφέρεια, ἣν δὴ σπειρικὴν καλοῦσιν· καὶ μὴ ἦ δὲ ὅλος ὁ κύκλος, ἀλλὰ τμήμα αὐτοῦ, πάλιν ἀπογεννήσει τὸ τοῦ κύκλου τμήμα σπειρικῆς ἐπιφανείας τμήμα, καθάπερ εἰς καὶ αἱ ταῖς κίουσιν ὑποκείμεναι σπεῖραι· τριῶν γὰρ οὐσῶν ἐπιφανειῶν ἐν τῷ καλουμένῳ ἀναγραφεί, ὃν δὴ τινες καὶ ἐμβολέα καλοῦσιν, δύο μὲν κοίλων τῶν ἄκρων, μᾶς δὲ μέσης καὶ κυρτῆς, ἅμα περιφερόμεναι αἱ τρεῖς ἀπογεννώσι τὸ εἶδος τῆς τοῖς κίουσιν ὑποκειμένης σπεύρας.

Δέον οὖν ἔστω τὴν ἀπογεννηθεῖσαν σπεῖραν ὑπὸ τοῦ $BΓΔΕ$ κύκλου μετρήσαι. δεδοσθω ἡ μὲν AB μονάδων κ , ἡ δὲ $BΓ$ διάμετρος μονάδων $\iota\beta$.

εἰλήφθω τὸ κέντρον τοῦ κύκλου τὸ Z , καὶ ἀπὸ τῶν A, Z τῷ ὑποκειμένῳ ἐπιπέδῳ πρὸς ὀρθὰς ἤχθωσαν αἱ $\Delta ZE, HA\Theta$. καὶ διὰ τῶν Δ, E τῇ AB παράλ-

MENSURATION: HERON OF ALEXANDRIA

A remains stationary, let AB revolve in the plane until it concludes its motion at the place where it started, the circle $B\Gamma\Delta E$ remaining throughout perpendicular to the plane of the horizontal. Then the circumference $B\Gamma\Delta E$ will generate a certain surface, which is called *spiric*; and if the whole circle do not revolve, but only a segment of it, the segment of the circle will again generate a segment of a spiric surface, such as are the *spirae* on which columns rest; for as there are three surfaces in the so-called *anagrapheus*, which some call also *emboleus*, two concave (the extremes) and one (the middle) convex, when the three are moved round simultaneously they generate the form of the *spira* on which columns rest.^a

Let it then be required to measure the spire generated by the circle $B\Gamma\Delta E$. Let AB be given as 20, and the diameter $B\Gamma$ as 12. Let Z be the centre of the circle, and through ^b A, Z let HAΘ, ΔZE be drawn perpendicular to the plane of the horizontal. And through Δ, E let ΔH, EΘ be drawn parallel to

^a The *ἀναγραφεύς* or *ἐμβολεύς* is the pattern or templet for applying to an architectural feature, in this case an Attic-Ionic column-base. The Attic-Ionic base consists essentially of two convex mouldings, separated by a concave one. In practice, there are always narrow vertical ribbons between the convex mouldings and the concave one, but Heron ignores them. In the *templet*, there are naturally two concave surfaces separated by a convex, and the kind of figure Heron had in mind appears to be that here illustrated. I am indebted to Mr. D. S. Robertson, Regius Professor of Greek in the University of Cambridge, for help in elucidating this passage.

MENSURATION : HERON OF ALEXANDRIA

AB. Now it is proved by Dionysodorus ^a in the book which he wrote *On the Spire* that the circle $BI\Delta E$ bears to half of the parallelogram $\Delta EH\Theta$ the same ratio as the spire generated by the circle $BI\Delta E$ bears to the cylinder having $H\Theta$ for its axis and $E\Theta$ for the radius of its base. Now, since BI is 12, ZI will be 6. But AI is 8 ; therefore AZ will be 14, and likewise $E\Theta$, which is the radius of the base of the aforesaid cylinder. Therefore the circle is given ; but the axis is also given ; for it is 12, since this is the length of ΔE . Therefore the aforesaid cylinder is also given ; and the parallelogram $\Delta\Theta$ is given, so that its half is also given. But the circle $BI\Delta E$ is also given ; for the diameter IB is given. Therefore the ratio of the circle $BI\Delta E$ to the parallelogram is given ; and so the ratio of the spire to the cylinder is given. And the cylinder is given ; therefore the volume of the spire is also given.

Following the analysis, the synthesis may thus be done. Take 12 from 20 ; the remainder is 8. And add 20 ; the result is 28. Let the measure be taken of the cylinder having for the diameter of its base 28 and for height 12 ; the resulting volume is 7392. Now let the area be found of a circle having a diameter 12 ; the resulting area, as we learnt, is 113 $\frac{1}{2}$. Take the half of 28 ; the result is 14. Multiply it by the half of 12 ; the result is 84. Now multiply

^a For Dionysodorus v. *supra*, p. 162 n. a and p. 364 n. a.

If $\Delta E = H\Theta = 2r$ and $E\Theta = a$, then the volume of the spire bears to the volume of the cylinder the ratio $2\pi a \cdot \pi r^2 : 2r \cdot \pi a^2$ or $\pi r : a$, which, as Dionysodorus points out, is identical with the ratio of the circle to half the parallelogram, that is, $\pi r^2 : ra$ or $\pi r : a$.

(iii.) *Division of a Circle*

Ibid. iii. 18, ed. H. Schöne (Heron iii.) 172. 13-174. 2

Τὸν δοθέντα κύκλον διελεῖν εἰς τρία ἴσα δυσὶν εὐθείαις. τὸ μὲν οὖν πρόβλημα ὅτι οὐ ῥητόν ἐστι, δῆλον, τῆς εὐχρηστίας δὲ ἕνεκεν διελοῦμεν αὐτὸν ὡς ἔγγιστα οὕτω. ἔστω ὁ δοθεὶς κύκλος, οὗ κέντρον τὸ Α, καὶ ἐνηρμόσθω εἰς αὐτὸν τρίγωνον ἰσοπλευρον, οὗ πλευρὰ ἡ ΒΓ, καὶ παράλληλος αὐτῇ ἡχθῶ ἡ ΔΑΕ καὶ ἐπεζεύχθωσαν αἱ ΒΔ, ΔΓ. λέγω, ὅτι τὸ ΔΒΓ τμήμα τρίτον ἔγγιστα ἐστὶ μέρος τοῦ ὅλου κύκλου. ἐπεζεύχθωσαν γὰρ αἱ ΒΑ, ΑΓ. ὁ ἄρα ΑΒΓΖΒ τομεὺς τρίτον ἐστὶ μέρος τοῦ ὅλου κύκλου. καὶ ἔστιν ἴσον τὸ ΑΒΓ τρίγωνον τῷ ΒΓΔ τριγώνῳ· τὸ ἄρα ΒΔΓΖ σχῆμα τρίτον μέρος ἐστὶ τοῦ ὅλου κύκλου, ᾧ δὴ μεῖζόν ἐστιν αὐτοῦ τὸ ΔΒΓ τμήμα ἀνεπαισθήτου ὄντος ὡς πρὸς τὸν ὅλον κύκλον. ὁμοίως δὲ καὶ ἑτέραν

MENSURATION: HERON OF ALEXANDRIA

7392 by $113\frac{1}{4}$ and divide the product by 84; the result is $9956\frac{1}{4}$. This will be the volume of the spire.

(iii.) *Division of a Circle*

Ibid. iii. 18, ed. H. Schöne (Heron iii.) 172. 13–174. 2

To divide a given circle into three equal parts by two straight lines. It is clear that this problem is not rational, and for practical convenience we shall make the division as closely as possible in this way. Let the given circle have A for its centre, and let there be inserted in it an equilateral triangle with side $B\Gamma$, and let $\Delta A E$ be drawn parallel to it, and let $B\Delta$, ΓE

be joined. I say that the segment $\Delta B\Gamma$ is approximately a third part of the whole circle. For let BA , $A\Gamma$ be joined. Then the sector $AB\Gamma ZB$ is a third part of the whole circle. And the triangle $AB\Gamma$ is equal to the triangle $B\Gamma\Delta$ [Eucl. i. 37]; therefore the figure $B\Delta\Gamma Z$ is a third part of the whole circle, and the excess of the segment $\Delta B\Gamma$ over it is negligible in comparison with the whole circle. Similarly, if we

Τὸ δοθὲν χωρίον μετρήσαι διὰ διόπτρας. ἔστω τὸ δοθὲν χωρίον περιεχόμενον ὑπὸ γραμμῆς

ἀτάκτου τῆς ΑΒΓΔΕΖΗΘ. ἐπεὶ οὖν ἐμάθομεν διὰ τῆς κατασκευασθείσης διόπτρας διάγειν πάσῃ τῇ δοθείσῃ εὐθείᾳ <έτέραν>² πρὸς ὀρθάς, ἔλαβόν τι σημεῖον ἐπὶ τῆς περιεχοῦσης τὸ χωρίον γραμμῆς

MENSURATION: HERON OF ALEXANDRIA

inscribe another side of the equilateral triangle, we may take away another third part; and therefore the remainder will also be a third part of the whole circle.^a

(iv.) *Measurement of an Irregular Area*

Heron, *Dioptra* ^b 23, ed. H. Schöne (Heron iii.)
260. 18-264. 15

To measure a given area by means of the dioptra. Let the given area be bounded by the irregular line ABΓΔΕΖΗΘ. Since we learnt to draw, by setting the dioptra, a straight line perpendicular to any other straight line, I took any point B on the line en-

^a Euclid, in his book *On Divisions of Figures* which has partly survived in Arabic, solved a similar problem—to draw in a given circle two parallel chords cutting off a certain fraction of the circle; Euclid actually takes the fraction as one-third. The general character of the third book of Heron's *Metrics* is very similar to Euclid's treatise.

It is in the course of this book (iii. 20) that Heron extracts the cube root of 100 by a method already noted (vol. i. pp. 60-63).

^b The dioptra was an instrument fulfilling the same purposes as the modern theodolite. An elaborate description of the instrument prefaces Heron's treatise on the subject, and it was obviously a fine piece of craftsmanship, much superior to the "parallactic" instrument with which Ptolemy had to work—another piece of evidence against an early date for Heron.

MENSURATION : HERON OF ALEXANDRIA

closing the area, and by means of the dioptra drew any straight line BH, and drew BΓ perpendicular to it, and drew another straight line ΓΖ perpendicular to this last, and similarly drew ΖΘ perpendicular to ΓΖ. And on the straight lines so drawn I took a series of points—on BH taking K, Λ, Μ, Ν, Ξ, Ο, on BΓ taking Π, Ρ, on ΓΖ taking Σ, Τ, Υ, Φ, Χ, Ψ, Ω, and on ΖΘ taking ς, ζ. And from the points so taken on the straight lines designated by the letters, I drew the perpendiculars K^λΛ, ΛΑ, Μ^αΑ, Ν^βΒ, Ξ^γΓ, Ο^δΔ, Π^εΕ, Ρ^ςς, Σ^ζΖ, Τ^ηΗ, Υ^θΘ, Φ^ιΔ, Χ^κΜ, Ψ^λΜ, ΩΕ, ς^μΜ, ζ^νΜ in such a manner that the extremities of the perpendiculars cut off from the line enclosing the area approximately straight lines. When this is done it will be possible to measure the area. For the parallelogram BΓΖΜ is right-angled; so that if we measure the sides by a chain or measuring-rod, which has been carefully tested so that it can neither expand nor contract, we shall obtain the area of the parallelogram. We may similarly measure the right-angled triangles and trapezia outside this by taking their sides; for BK^λ, BΠ^εΕ, ΓΡ^ςς, ΓΣ^ζΖ, ΖΩΕ, Ζς^μΜ, ΘΗ^κΜ are right-angled triangles, and the remaining figures are right-angled trapezia. The triangles are measured by multiplying together the sides about the right angle and taking half the product. As for the trapezia—take half of the sum of the two parallel sides and multiply it by the perpendicular upon

^a Heron's *Mechanics* in three books has survived in Arabic, but has obviously undergone changes in form. It begins with the problem of arranging toothed wheels so as to move

MENSURATION: HERON OF ALEXANDRIA

them, as, for example, half of $K\Delta$, AA by $K\Delta$; and similarly for the remainder. Then the whole area will have been measured by means of the parallelogram in the middle and the triangles and trapezia outside it. If perchance the curved line between the perpendiculars drawn to the sides of the parallelogram should not approximate to a straight line (as, for example, the curve $\Gamma\Delta$ between $\Xi\Gamma$, $O\Delta$), but to an arc, we may measure it thus: Draw ΔM perpendicular to $O\Delta$, and on it take a series of points M , M , and from them draw MM , MM perpendicular to $M\Delta$, so that the portions between the straight lines so drawn approximate to straight lines, and again we can measure the parallelogram $M\Xi O\Delta$ and the triangle $MM\Delta$, and the trapezium ΓMMM , and also the other trapezium, and so we shall obtain the area bounded by the line $\Gamma MM\Delta$ and the straight lines $\Gamma\Xi$, ΞO , $O\Delta$.

MENSURATION : HERON OF ALEXANDRIA

juxtaposition of toothed wheels.^a Let a framework be prepared like a chest ; and in the long, parallel walls let there lie axles parallel one to another, resting at such intervals that the toothed wheels fitting on to them will be adjacent and will engage one with the other, as we shall explain. Let $AB\Gamma\Delta$ be the afore-said chest, and let EZ be an axle lying in it, as stated above, and able to revolve freely. Fitting on to this axle let there be a toothed wheel $H\Theta$ whose diameter, say, is five times the diameter of the axle EZ . In order that the construction may serve as an illustration, let the weight to be raised be 1000 talents, and let the moving force be 5 talents, that is, let the man or slave who moves it be able by himself, without mechanical aid, to lift 5 talents. Then if the rope holding the load passes through some aperture in

Βαρουλός was substituted for the original opening of the *Mechanics*, which had become lost.

Other problems dealt with in the *Mechanics* are the paradox of motion known as Aristotle's wheel, the parallelogram of velocities, motion on an inclined plane, centres of gravity, the five mechanical powers, and the construction of engines. Edited with a German translation by L. Nix and W. Schmidt, it is published as vol. ii. in the Teubner Heron.

^a Perhaps "rollers."

the wall AB and is coiled round the axle EZ, the rope holding the load will move the weight as it winds up. In order that the wheel HΘ may be moved, a force of more than 200 talents is necessary, owing to the diameter of the wheel being, as postulated, five times the diameter of the axle ; for this was shown in the proofs of the five mechanical powers.^a We have [not, however . . .] a force of 200 talents, but only of 5. Therefore let there be another axle KΛ, lying parallel to EZ, and having the toothed wheel MN fitting on to it. Now let the teeth of the wheel HΘ be such as to engage with the teeth of the wheel MN. On the same axle KΛ let there be fitted the wheel ΞO, whose diameter is likewise five times the diameter of the wheel MN. Now, in consequence, anyone wishing to move the weight by means of the wheel ΞO will need a force of 40 talents, since the fifth part of 200 talents is 40 talents. Again, then, let another toothed wheel IΠ lie alongside the toothed wheel ΞO, and let there be fitted to the toothed wheel IΠ another toothed wheel ΣΤ whose diameter is likewise five times the diameter of the wheel IΠ ; then the force needing to be applied to the wheel ΣΤ will be 8 talents ; but the force actually available

MENSURATION : HERON OF ALEXANDRIA

to us is 5 talents. Let there be placed another toothed wheel $\Upsilon\Phi$ engaging with the toothed wheel $\Sigma\Gamma$; and fitting on to the axle of the wheel $\Upsilon\Phi$ let there be a toothed wheel $X\Psi$, whose diameter bears to the diameter of the wheel $\Upsilon\Phi$ the same ratio as 8 talents bears to the given force 5 talents.

When this construction is done, if we imagine the chest $AB\Gamma\Delta$ as lying above the ground, with the weight hanging from the axle EZ and the force raising it applied to the wheel $X\Psi$, neither of them will descend, provided the axles revolve freely and the juxtaposition of the wheels is accurate, but as in a beam the force will balance the weight. But if to one of them we add another small weight, the one to which the weight was added will tend to sink down and will descend, so that if, say, a mina is added to one of the 5 talents in the force it will overcome and draw the weight. But instead of this addition to the force, let there be a screw having a spiral which engages the teeth of the wheel, and let it revolve freely about pins in round holes, of which one projects beyond the chest through the wall $\Gamma\Delta$ adjacent to the screw; and then let the projecting piece be made square and be given a handle $\zeta\varsigma$. Anyone who takes this handle and turns, will turn the screw and the wheel $X\Psi$, and therefore the wheel $\Upsilon\Phi$ joined to it. Similarly the adjacent wheel $\Sigma\Gamma$ will revolve, and $\Pi\Pi$ joined to it, and then the adjacent wheel $\Lambda\Theta$, and then MN fitting

on to this last, and then the adjacent wheel $H\Theta$, and so finally the axle EZ fitting on to it; and the rope, winding round the axle, will move the weight. That it will move the weight is obvious because there has been added to the one force that moving the handle which describes a circle greater than that of the screw; for it has been proved that greater circles prevail over lesser when they revolve about the same centre.

(d) OPTICS: EQUALITY OF ANGLES OF INCIDENCE AND REFLECTION

Damianus,^a *On the Hypotheses in Optics* 14,
ed. R. Schöne 20. 12-18

For the mechanician Heron showed in his *Catoptrica* that of all [mutually] inclined straight lines drawn from the same homogenous straight line [surface] to the same [points], those are the least which are so inclined as to make equal angles. In his proof he says that if Nature did not wish to lead our sight in vain, she would incline it so as to make equal angles.

Olympiodorus, *Commentary on Aristotle's Meteora* iii. 2
(371 b 18), ed. Stüve 212. 5-213. 21

For this would be agreed by all, that Nature does nothing in vain nor labours in vain; but if we do not grant that the angles of incidence and reflection are equal, Nature would be labouring in vain by following

^a Damianus, or Heliodorus, of Larissa (date unknown) is the author of a small work on optics, which seems to be an abridgement of a large work based on Euclid's treatise. The full title given in some mss.—*Δαμιανοῦ φιλοσόφου τοῦ Ἡλιοδώρου Λαρισσαίου Περὶ ὀπτικῶν ὑποθέσεων βιβλία β* leaves uncertain which was his real name.

MENSURATION : HERON OF ALEXANDRIA
 unequal angles, and instead of the eye apprehending the visible object by the shortest route it would do so by a longer. For straight lines so drawn from the eye to the mirror and thence to the visible object as to make¹ unequal angles will be found to be greater than straight lines so drawn as to make equal angles. That this is true, is here made clear.

For let the straight line AB be supposed to be the mirror, and let Γ be the observer, Δ the visible object, and let E be a point on the mirror, falling on which the sight is bent towards the visible object, and let ΓE , $E\Delta$ be joined. I say that the angle $AE\Gamma$ is equal to the angle ΔEB .²

MENSURATION : HERON OF ALEXANDRIA

For if it be not equal, let there be another point Z , on the mirror, falling on which the sight makes unequal angles, and let $\Gamma Z, Z\Delta$ be joined. It is clear that the angle ΓZA is greater than the angle ΔZE . I say that the sum of the straight lines $\Gamma Z, Z\Delta$ which make unequal angles with the base line AB , is greater than the sum of the straight lines $\Gamma E, E\Delta$, which make equal angles with AB . For let a perpendicular be drawn from Δ to AB at the point H and let it be produced in a straight line to Θ . Then it is obvious that the angles at H are equal; for they are right angles. And let $\Delta H = H\Theta$, and let ΘZ and ΘE be joined. This is the construction. Then since $\Delta H = H\Theta$, and the angle ΔHE is equal to the angle ΘHE , while HE is a common side of the two triangles, the triangle $H\Theta E$ is equal to the triangle ΔHE , and the remaining angles, subtended by the equal sides are severally equal one to the other [Eucl. i. 4]. Therefore $\Theta E = E\Delta$. Again, since $H\Delta = H\Theta$ and angle $\Delta HZ =$ angle ΘHZ , while HZ is common to the two triangles ΔHZ and ΘHZ , the triangle $ZH\Delta$ is equal to the triangle ΘHZ [*ibid.*]. Therefore $\Theta Z = Z\Delta$. And since $\Theta E = E\Delta$, let $E\Gamma$ be added to both. Then the sum of the two straight lines $\Gamma E, E\Delta$ is equal to the sum of the two straight lines $\Gamma E, E\Theta$. Therefore the whole $\Gamma\Theta$ is equal to the sum of the two straight lines $\Gamma E, E\Delta$. And since in any triangle the sum of two sides is always greater than

(e) QUADRATIC EQUATIONS

Heron, *Geom.* 21. 9-10, ed. Heiberg (Heron iv.) 380. 15-31

Δοθέντων συναμφοτέρων τῶν ἀριθμῶν ἡγουν τῆς διαμέτρου, τῆς περιμέτρου καὶ τοῦ ἑμβαδοῦ τοῦ κύκλου ἐν ἀριθμῷ ἐνὶ διαστεῖλαι καὶ εὑρεῖν ἕκαστον ἀριθμόν. ποίει οὕτως· ἔστω ὁ δοθεὶς ἀριθμὸς μονάδες $\sigma\iota\beta$. ταῦτα ἀεὶ ἐπὶ τὰ $\rho\nu\delta$ · γίνονται μυριάδες γ καὶ $\beta\chi\mu\eta$. τούτοις προστίθει καθολικῶς $\omega\mu\alpha$ · γίνονται μυριάδες τρεῖς καὶ $\gamma\upsilon\pi\theta$. ὧν πλευρὰ τετράγωνος γίνεται $\rho\pi\gamma$. ἀπὸ τούτων κούφισον $\kappa\theta$. λοιπὰ $\rho\nu\delta$. ὧν μέρος $\iota\alpha'$ γίνεται $\iota\delta$. τοσούτου ἡ διάμετρος τοῦ κύκλου. ἐὰν δὲ θέλῃς καὶ τὴν περιφέρειαν εὑρεῖν, ὑφείλον τὰ $\kappa\theta$ ἀπὸ τῶν $\rho\pi\gamma$. λοιπὰ $\rho\nu\delta$. ταῦτα ποίησον $\delta\iota\varsigma$. γίνονται $\tau\eta$. τούτων λαβὲ μέρος ζ' . γίνονται $\mu\delta$. τοσούτου ἡ

^a The proof here given appears to have been taken by Olympiodorus from Heron's *Catoptrica*, and it is substantially identical with the proof in *De Speculis* 4. This work was formerly attributed to Ptolemy, but the discovery of Ptolemy's *Optics* in Arabic has encouraged the belief, now

MENSURATION : HERON OF ALEXANDRIA

the remaining side, in whatever way these may be taken [Eucl. i. 20], therefore in the triangle $\Theta Z\Gamma$ the sum of the two sides ΘZ , $Z\Gamma$ is greater than the one side $\Gamma\Theta$. But

$$\Gamma\Theta = \Gamma E + E\Delta;$$

$$\therefore \Theta Z + Z\Gamma > \Gamma E + E\Delta.$$

But $\Theta Z = Z\Delta;$

$$\therefore Z\Gamma + Z\Delta > \Gamma E + E\Delta.$$

And ΓZ , $Z\Delta$ make unequal angles; therefore the sum of straight lines making unequal angles is greater than the sum of straight lines making equal angles; which was to be proved.^a

(e) QUADRATIC EQUATIONS

Heron, *Geometrica* 21. 9-10, ed. Heiberg
(Heron iv.) 380. 15-31

Given the sum of the diameter, perimeter and area of a circle, to find each of them separately. It is done thus: Let the given sum be 212. Multiply this by 154; the result is 32648. To this add 841, making 33489, whose square root is 183. From this take away 29, leaving 154, whose eleventh part is 14; this will be the diameter of the circle. If you wish to find the circumference, take 29 from 183, leaving 154; double this, making 308, and take the seventh part, which is 44; this will be the perimeter. To

usually held, that it is a translation of Heron's *Catoptrica*. The translation, made by William of Moerbeke in 1269, can be shown by internal evidence to have been made from the Greek original and not from an Arabic translation. It is published in the Teubner edition of Heron's works, vol. ii. part i.

(f) INDETERMINATE ANALYSIS

Heron, *Geom.* 24. 1, ed. Heiberg
(Heron iv.) 414. 28–415. 10

Εὐρεῖν δύο χωρία τετράγωνα, ὅπως τὸ τοῦ
πρώτου ἔμβαδὸν τοῦ τοῦ δευτέρου ἔμβαδοῦ ἔσται
τριπλάσιον. ποιῶ οὕτως· τὰ γ κύβισον· γίνονται

* If d is the diameter of the circle, then the given relation is that

$$d + \frac{22}{7}d + \frac{11}{14}d^2 = 212,$$

$$\text{i.e.} \quad \frac{11}{14}d^2 + \frac{29}{7}d = 212.$$

To solve this quadratic equation, we should divide by $\frac{1}{11}$ so as to make the first term a square; Heron makes the first term a square by multiplying by the lowest requisite factor, in this case 154, obtaining the equation

$$11^2 d^2 + 2 \cdot 29 \cdot 11d = 154 \cdot 212.$$

By adding 841 he completes the square on the left-hand side

$$\begin{aligned} (11d + 29)^2 &= 154 \cdot 212 + 841 \\ &= 32648 + 841 \\ &= 33489. \end{aligned}$$

$$\therefore 11d + 29 = 183.$$

$$\therefore 11d = 154,$$

$$\text{and } d = 14.$$

The same equation is again solved in *Geom.* 24. 46 and a similar one in *Geom.* 24. 47. Another quadratic equation is solved in *Geom.* 24. 3 and the result of yet another is given in *Metr.* iii. 4.

MENSURATION: HERON OF ALEXANDRIA

find the area. It is done thus: Multiply the diameter, 14, by the perimeter, 44, making 616; take the fourth part of this, which is 154; this will be the area of the circle. The sum of the three numbers is 212.^a

(f) INDETERMINATE ANALYSIS ^b

Heron, *Geometrica* 24. 1, ed. Heiberg
(Heron iv.) 414. 28-415. 10

To find two rectangles such that the area of the first is three times the area of the second.^c I proceed thus:

^b The Constantinople ms. in which Heron's *Metrica* was found in 1896 contains also a number of interesting problems in indeterminate analysis; and two were already extant in Heron's *Geōponicus*. The problems, thirteen in all, are now published by Heiberg in Heron iv. 414. 28-426. 29.

^c It appears also to be a condition that the perimeter of the second should be three times the perimeter of the first. If we substitute any factor n for 3 the general problem becomes: To solve the equations

$$u + v = n(x + y) \quad . \quad . \quad . \quad (1)$$

$$xy = n \cdot uv \quad . \quad . \quad . \quad (2)$$

The solution given is equivalent to

$$\begin{aligned} x &= 2n^3 - 1, & y &= 2n^3 \\ u &= n(4n^3 - 2), & v &= n. \end{aligned}$$

Zeuthen (*Bibliotheca mathematica*, viii. (1907-1908), pp. 118-134) solves the problem thus: Let us start with the hypothesis that $v = n$. It follows from (1) that u is a multiple of n , say nz . We have then

$$x + y = 1 + z,$$

while by (2)

$$xy = n^3 z,$$

whence

$$xy = n^3(x + y) - n^3$$

or

$$(x - n^3)(y - n^3) = n^3(n^3 - 1).$$

An obvious solution of this equation is

$$x - n^3 = n^3 - 1, \quad y - n^3 = n^3,$$

which gives $z = 4n^3 - 2$, whence $u = n(4n^3 - 2)$. The other values follow.

MENSURATION: HERON OF ALEXANDRIA

Take the cube of 3, making 27 ; double this, making 54. Now take away 1, leaving 53. Then let one side be 53 feet and the other 54 feet. As for the other rectangle, [I proceed] thus : Add together 53 and 54, making 107 feet : multiply this by 3, [making 321 ; take away 3], leaving 318. Then let one side be 318 feet and the other 3 feet. The area of the one will be 954 feet and of the other 2862 feet.^a

Ibid. 24. 10, ed. Heiberg (Heron iv.) 422. 15-424. 5

In a right-angled triangle the sum of the area and the perimeter is 280 feet ; *to separate the sides and find the area.* I proceed thus : Always look for the factors ; now 280 can be factorized into 2 . 140, 4 . 70, 5 . 56, 7 . 40, 8 . 35, 10 . 28, 14 . 20. By inspection, we find 8 and 35 fulfil the requirements. For take one-eighth of 280, getting 35 feet. Take 2 from 8, leaving 6 feet. Then 35 and 6 together make 41 feet. Multiply this by itself, making 1681 feet. Now multiply 35 by 6, getting 210 feet. Multiply this by 8, getting 1680 feet. Take this away from the 1681, leaving 1, whose square root is 1. Now take the 41 and subtract 1, leaving 40, of which the half is 20 ; this is the perpendicular, 20 feet. And again take 41 and add 1, getting 42 feet, of which the half is 21 ; and let this be the base, 21 feet. And take 35 and subtract 6, leaving 29 feet. Now multiply

^a The term "feet," *πόδες*, is used by Heron indiscriminately of lineal feet, square feet and the sum of numbers of lineal and square feet.

GREEK MATHEMATICS

πόδες $\overline{\kappa\theta}$. ἄρτι θὲς τὴν κάθετον ἐπὶ τὴν βάσιν
 ὧν \angle' γίνεται πόδες $\overline{\sigma\iota}$. καὶ αἱ τρεῖς πλευραὶ
 περιμετρούμεναι ἔχουσι πόδας $\overline{\omicron}$. ὁμοῦ σύνθεσ μετὰ
 τοῦ ἐμβαδοῦ· γίνονται πόδες $\overline{\sigma\pi}$.

^a Heath (*H.G.M.* ii. 446-447) shows how this solution can be generalized. Let a, b be the sides of the triangle containing the right angle, c the hypotenuse, S the area of the triangle, r the radius of the inscribed circle; and let

$$s = \frac{1}{2}(a + b + c).$$

Then

$$S = rs = \frac{1}{2}ab, \quad r + s = a + b, \quad c = s - r.$$

Solving the first two equations, we have

$$\frac{a}{b} \Big\} = \frac{1}{2} \{ r + s \mp \sqrt{\{(r + s)^2 - 8rs\}} \},$$

and this formula is actually used in the problem. The

MENSURATION: HERON OF ALEXANDRIA

the perpendicular and the base together, [getting 420], of which the half is 210 feet; and the three sides comprising the perimeter amount to 70 feet; add them to the area, getting 280 feet.^a

method is to take the sum of the area and the perimeter $S + 2s$, separated into its two obvious factors $s(r+2)$, to put $s(r+2) = A$ (the given number), and then to separate A into suitable factors to which s and $r+2$ may be equated. They must obviously be such that sr , the area, is divisible by 6.

In the given problem $A = 280$, and the suitable factors are $r+2=8$, $s=35$, because r is then equal to 6 and rs is a multiple of 6. Then

$$a = \frac{1}{2}[6 + 35 - \sqrt{\{(6 + 35)^2 - 8 \cdot 6 \cdot 35\}}] = \frac{1}{2}(41 - 1) = 20,$$

$$b = \frac{1}{2}(41 + 1) = 21,$$

$$c = 35 - 6 = 29.$$

This problem is followed by three more of the same type.

τῇδε πόσου σοφίῃ τέρμ' ἐπέρησε βίου.

* There are in the *Anthology* 16 epigrams which are algebraical problems. Most of them (xiv. 116-146) were collected by Metrodorus, a grammarian who lived about A.D. 500, but their origin is obviously much older and many belong to a type described by Plato and the scholiast to the Charmides (v. vol. i. pp. 16, 20).

Problems in indeterminate analysis solved before the time of Diophantus include the Pythagorean and Platonic methods of finding numbers representing the sides of right-angled triangles (v. vol. i. pp. 90-95), the methods (also Pythagorean) of finding "side- and diameter-numbers" (vol. i. pp. 132-139), Archimedes' *Cattle Problem* (v. *supra*, pp. 202-205) and Heron's problems (v. *supra*, pp. 504-509).

XXIII. ALGEBRA : DIOPHANTUS

(a) GENERAL

Palatine Anthology ^a xiv. 126, *The Greek Anthology*, ed.
Paton (L.C.L.) v. 92-93

THIS tomb holds Diophantus. Ah, what a marvel !
And the tomb tells scientifically the measure of his
life. God vouchsafed that he should be a boy for the
sixth part of his life ; when a twelfth was added, his
cheeks acquired a beard ; He kindled for him the
light of marriage after a seventh, and in the fifth year
after his marriage He granted him a son. Alas !
late-begotten and miserable child, when he had
reached the measure of half his father's life, the chill
grave took him. After consoling his grief by this
science of numbers for four years, he reached the end
of his life.^b

Diophantus's surviving works and ancillary material are admirably edited by L. Tannery in two volumes of the Teubner series (Leipzig, 1905). There is a French translation by Paul Ver Eecke, *Diophante d'Alexandre* (Bruges, 1926). The history of Greek algebra as a whole is well treated by G. F. Nesselmann, *Die Algebra der Griechen*, and by T. L. Heath, *Diophantus of Alexandria: A Study in the History of Greek Algebra*, 2nd ed. 1910.

^b If x was his age at death, then

$$\frac{1}{6}x + \frac{1}{12}x + \frac{1}{7}x + 5 + \frac{1}{2}x + 4 = x,$$

whence

$$x = 84.$$

Theon Alex. in Ptol. *Math. Syn. Comm.* i. 10, ed.
Rome, *Studi e Testi*, lxxii. (1936), 453. 4-6

Καθ' ἃ καὶ Διόφαντός φησι· “ τῆς γὰρ μονάδος ἀμεταθέτου οὔσης καὶ ἐστώσης πάντοτε, τὸ πολλαπλασιαζόμενον εἶδος ἐπ' αὐτὴν αὐτὸ τὸ εἶδος ἔσται.”

Dioph. *De polyg. num.* [5], Dioph. ed. Tannery i.
470. 27-472. 4

Καὶ ἀπεδείχθη τὸ παρὰ Ὑψικλεῖ ἐν ὄρω λεγόμενον, ὅτι, “ ἐὰν ὦσιν ἀριθμοὶ ἀπὸ μονάδος ἐν ἴσῃ ὑπεροχῇ ὅποσοιοῦν, μονάδος μενούσης τῆς ὑπεροχῆς, ὃ σύμπας ἐστὶν <τρίγωνος, δυάδος δέ>,¹ τετράγωνος, τριάδος δέ, πεντάγωνος· λέγεται δὲ τὸ πλῆθος τῶν γωνιῶν κατὰ τὸν δυάδι μείζονα τῆς ὑπεροχῆς, πλευραὶ δὲ αὐτῶν τὸ πλῆθος τῶν ἐκτεθέντων σὺν τῇ μονάδι.”

Mich. Psell. *Epist.*, Dioph. ed. Tannery ii. 38. 22-39. 1

Περὶ δὲ τῆς Αἰγυπτιακῆς μεθόδου ταύτης Διόφαντος μὲν διέλαβεν ἀκριβέστερον, ὃ δὲ λογιώτατος Ἀνατόλιος τὰ συνεκτικώτατα μέρη τῆς κατ'

¹ τρίγωνος, δυάδος δέ add. Bachet.

^a Cf. Dioph. ed. Tannery i. 8. 13-15. The word *εἶδος*, as will be seen in due course, is regularly used by Diophantus for a *term* of an equation.

ALGEBRA : DIOPHANTUS

Theon of Alexandria, *Commentary on Ptolemy's Syntaxis*
i: 10, ed. Rome, *Studi e Testi*, lxxii. (1936), 453. 4-6

As Diophantus says: "The unit being without dimensions and everywhere the same, a term that is multiplied by it will remain the same term."^a

Diophantus, *On Polygonal Numbers* [5], Dioph. ed.
Tannery i. 470. 27-472. 4

There has also been proved what was stated by Hypsicles in a definition, namely, that "if there be as many numbers as we please beginning from 1 and increasing by the same common difference, then, when the common difference is 1, the sum of all the numbers is a triangular number; when 2, a square number; when 3, a pentagonal number [; and so on]. The number of angles is called after the number which exceeds the common difference by 2, and the sides after the number of terms including 1."^b

Michael Psellus,^c *A Letter*, Dioph. ed. Tannery ii.
38. 22-39. 1

Diophantus dealt more accurately with this Egyptian method, but the most learned Anatolius collected the most essential parts of the theory as stated by

^b *i.e.*, the n th a -gonal number (1 being the first) is $\frac{1}{2}n\{2 + (n-1)(a-2)\}$; *v.* vol. i. p. 98 n. a.

^c Michael Psellus, "first of philosophers" in a barren age, flourished in the latter part of the eleventh century A.D. There has survived a book purporting to be by Psellus on arithmetic, music, geometry and astronomy, but it is clearly not all his own work. In the geometrical section it is observed that the most favoured method of finding the area of a circle is to take the mean between the inscribed and circumscribed squares, which would give $\pi = \sqrt{8} = 2.8284271$.

ἐκεῖνον ἐπιστήμης ἀπολεξάμενος ἐτέρως¹ Διοφάντῳ συνοπτικώτατα προσεφώνησε.

Dioph. *Arith.* i., Praef., Dioph. ed. Tannery i. 14. 25-16. 7

Νῦν δ' ἐπὶ τὰς προτάσεις χωρήσωμεν ὁδόν, πλείστην ἔχοντες τὴν ἐπ' αὐτοῖς τοῖς εἵδεσι συνηθροισμένην ὕλην. πλείστων δ' ὄντων τῷ ἀριθμῷ καὶ μεγίστων τῷ ὄγκῳ, καὶ διὰ τοῦτο βραδέως βεβαιουμένων ὑπὸ τῶν παραλαμβανόντων αὐτὰ καὶ ὄντων ἐν αὐτοῖς δυσμνημονευτῶν, ἐδοκίμασα τὰ ἐν αὐτοῖς ἐπιδεχόμενα² διαιρεῖν, καὶ μάλιστα τὰ ἐν ἀρχῇ ἔχοντα στοιχειώδως ἀπὸ ἀπλουστερῶν ἐπὶ σκολιώτερα διελεῖν ὥς προσῆκεν. οὕτως γὰρ εὐόδευτα γενήσεται τοῖς ἀρχομένοις, καὶ ἡ ἀγωγὴ αὐτῶν μνημονευθήσεται, τῆς πραγματείας αὐτῶν ἐν τρισκαίδεκα βιβλίοις γεγεννημένης.

Ibid. v. 3, Dioph. ed. Tannery i. 316. 6

Ἔχομεν ἐν τοῖς Πορίσμασιν.

¹ ἐτέρως Tannery, ἐτέρῳ codd.

² The two passages cited before this one allow us to infer that Diophantus must have lived between Hypsicles and Theon, say 150 B.C. to A.D. 350. Before Tannery edited Michael Psellus's letter, there was no further evidence, but it is reasonable to infer from this letter that Diophantus was a contemporary of Anatolius, bishop of Laodicea about A.D. 280 (v. vol. i. pp. 2-3). For references by Plato and a scholiast to the Egyptian methods of reckoning, v. vol. i. pp. 16, 20.

³ Of these thirteen books in the *Arithmetica*, only six

ALGEBRA : DIOPHANTUS

him in a different way and in the most concise form, and dedicated his work to Diophantus.^a

Diophantus, *Arithmetica* i., Preface, Dioph. ed. Tannery i.
14. 25-16. 7

Now let us tread the path to the propositions themselves, which contain a great mass of material compressed into the several species. As they are both numerous and very complex to express, they are only slowly grasped by those into whose hands they are put, and include things hard to remember; for this reason I have tried to divide them up according to their subject-matter, and especially to place, as is fitting, the elementary propositions at the beginning in order that passage may be made from the simpler to the more complex. For thus the way will be made easy for beginners and what they learn will be fixed in their memory; the treatise is divided into thirteen books.^b

Ibid. v. 3, Dioph. ed. Tannery i. 316. 6

We have it in the Porisms.^c

have survived. Tannery suggests that the commentary on it written by Hypatia, daughter of Theon of Alexandria, extended only to these first six books, and that consequently little notice was taken of the remaining seven. There would be a parallel in Eutocius's commentaries on Apollonius's *Conics*. Nesselmann argues that the lost books came in the middle, but Tannery (Dioph. ii. xix-xxi) gives strong reasons for thinking it is the last and most difficult books which have been lost.

^c Whether this collection of propositions in the Theory of Numbers, several times referred to in the *Arithmetica*, formed a separate treatise from, or was included in, that work is disputed; Hultsch and Heath take the former view, in my opinion judiciously, but Tannery takes the latter.

(b) NOTATION

Ibid. i., Praef., Dioph. ed. Tannery i. 2. 3-6. 21

Τὴν εὕρεσιν τῶν ἐν τοῖς ἀριθμοῖς προβλημάτων, τιμιώτατέ μοι Διονύσιε, γινώσκων σε σπουδαίως ἔχοντα μαθεῖν, [ὀργανῶσαι τὴν μέθοδον]¹ ἔπειράθην, ἀρξάμενος ἀφ' ὧν συνέστηκε τὰ πράγματα θεμελίων, ὑποστήσαι τὴν ἐν τοῖς ἀριθμοῖς φύσιν τε καὶ δύναμιν.

Ἴσως μὲν οὖν δοκεῖ τὸ πρᾶγμα δυσχερέστερον, ἐπειδὴ μήπω γνώριμόν ἐστιν, δυσέλπιστοι γὰρ εἰς κατόρθωσίν εἰσιν αἱ τῶν ἀρχομένων ψυχαί, ὅμως δ' εὐκατάληπτόν σοι γενήσεται, διὰ τε τὴν σὴν προθυμίαν καὶ τὴν ἐμὴν ἀπόδειξιν· ταχεῖα γὰρ εἰς μάθησιν ἐπιθυμία προσλαβοῦσα διδαχὴν.

Ἀλλὰ καὶ πρὸς τοῖσδε γινώσκοντί σοι πάντας τοὺς ἀριθμοὺς συγκειμένους ἐκ μονάδων πλήθους τινός, φανερόν καθέστηκεν εἰς ἄπειρον ἔχειν τὴν ὑπαρξιν. τυγχανόντων δὴ οὖν ἐν τούτοις

ALGEBRA : DIOPHANTUS

(b) NOTATION ^a

Ibid. i., Preface, Dioph. ed. Tannery i. 2. 3-6. 21

Knowing that you are anxious, my most esteemed Dionysius, to learn how to solve problems in numbers, I have tried, beginning from the foundations on which the subject is built, to set forth the nature and power in numbers.

Perhaps the subject will appear to you rather difficult, as it is not yet common knowledge, and the minds of beginners are apt to be discouraged by mistakes; but it will be easy for you to grasp, with your enthusiasm and my teaching; for keenness backed by teaching is a swift road to knowledge.

As you know, in addition to these things, that all numbers are made up of some multitude of units, it is clear that their formation has no limit. Among them are—

squares, which are formed when any number is multiplied by itself; the number itself is called the *side of the square* ^b ;

cubes, which are formed when squares are multiplied by their sides,

square-squares, which are formed when squares are multiplied by themselves;

square-cubes, which are formed when squares are

^a This subject is admirably treated, with two original contributions, by Heath, *Diophantus of Alexandria*, 2nd ed., pp. 34-53. Diophantus's method of representing large numbers and fractions has already been discussed (vol. i. pp. 44-45). Among other notations used by Diophantus are $\square^{\circ s}$, declined throughout its cases, for *τετράγωνος*; and $\iota\sigma$. (apparently $\iota\sigma$ in the archetype) for the sign =, connecting two sides of an equation.

^b Or "square root."

GREEK MATHEMATICS

αὐτὴς ἀπὸ τῆς αὐτῆς αὐτοῖς πλευρᾶς κύβους πολυ-
πλασιασθέντων,

ὧν δὲ κυβοκύβων, οἳ εἰσιν ἐκ κύβων ἐφ' ἑαυτοὺς
ολυπλασιασθέντων,

ἔκ τε τῆς τούτων ἥτοι συνθέσεως ἢ ὑπεροχῆς
πολυπλασιασμοῦ ἢ λόγου τοῦ πρὸς ἀλλήλους ἢ
αἱ ἐκάστων πρὸς τὰς ἰδίας πλευρὰς σύμβαίνει
λέκεσθαι πλείστα προβλήματα ἀριθμητικά· λύεται
ἢ βαδίζοντός σου τὴν ὑποδειχθησομένην ὁδόν.

Ἐδοκιμάσθη οὖν ἕκαστος τούτων τῶν ἀριθμῶν
υντομωτέραν ἐπωνυμίαν κτησάμενος στοιχεῖον τῆς
οιημητικῆς θεωρίας εἶναι· καλεῖται οὖν ὁ μὲν
ἑτράγωνος δύναμις καὶ ἔστιν αὐτῆς σημεῖον τὸ
ἐπίσημον ἔχον Υ , Δ^{Υ} δύναμις·

ὁ δὲ κύβος καὶ ἔστιν αὐτοῦ σημεῖον \mathbf{K} ἐπίσημον
ἔχον Υ , \mathbf{K}^{Υ} κύβος·

ὁ δὲ ἐκ τετραγώνου ἐφ' ἑαυτὸν πολυπλασια-
θέντος δυναμοδύναμις καὶ ἔστιν αὐτοῦ σημεῖον
ἔλτα δύο ἐπίσημον ἔχοντα Υ , $\Delta^{\Upsilon}\Delta$ δυναμοδύναμις·

ὁ δὲ ἐκ τετραγώνου ἐπὶ τὸν ἀπὸ τῆς αὐτῆς αὐτῷ
λευρᾶς κύβου πολυπλασιασθέντος δυναμόκυβος
καὶ ἔστιν αὐτοῦ σημεῖον τὰ $\Delta\mathbf{K}$ ἐπίσημον ἔχοντα
, $\Delta\mathbf{K}^{\Upsilon}$ δυναμόκυβος·

ὁ δὲ ἐκ κύβου ἑαυτὸν πολυπλασιάσαντος κυβό-
κυβος καὶ ἔστιν αὐτοῦ σημεῖον δύο κάππα ἐπίσημον
ἔχοντα Υ , $\mathbf{K}^{\Upsilon}\mathbf{K}$ κυβόκυβος.

ALGEBRA : DIOPHANTUS

multiplied by the cubes formed from the same side ;

cube-cubes, which are formed when cubes are multiplied by themselves ;

and it is from the addition, subtraction, or multiplication of these numbers or from the ratio which they bear one to another or to their own sides that most arithmetical problems are formed ; you will be able to solve them if you follow the method shown below.

Now each of these numbers, which have been given abbreviated names, is recognized as an element in arithmetical science ; the *square* [of the unknown quantity]^a is called *dynamis* and its sign is Δ with the index Υ , that is Δ^Υ ;

the cube is called *cubus* and has for its sign K with the index Υ , that is K^Υ ;

the square multiplied by itself is called *dynamodynamis* and its sign is two deltas with the index Υ , that is $\Delta^\Upsilon\Delta$;

the square multiplied by the cube formed from the same root is called *dynamocubus* and its sign is ΔK with the index Υ , that is ΔK^Υ ;

the cube multiplied by itself is called *cubocubus* and its sign is two kappas with the index Υ , $K^\Upsilon K$.

^a It is not here stated in so many words, but becomes obvious as the argument proceeds that *δύναμις* and its abbreviation are restricted to the square of the *unknown* quantity ; the square of a determinate number is *τετράγωνος*. There is only one term, *κύβος*, for the cube both of a determinate and of the unknown quantity. The higher terms, when written in full as *δυναμοδύναμις*, *δυναμόκυβος* and *κυβόκυβος*, are used respectively for the fourth, fifth and sixth powers both of determinate quantities and of the unknown, but their abbreviations, and the one for *κύβος*, are used to denote powers of the unknown only.

Ὁ δὲ μηδὲν τούτων τῶν ιδιωμάτων κτησάμενος, ἔχων δὲ ἐν ἑαυτῷ πλήθος μονάδων ἀόριστον, ἀριθμὸς καλεῖται καὶ ἔστιν αὐτοῦ σημεῖον τὸ Ξ .

Ἔστι δὲ καὶ ἕτερον σημεῖον τὸ ἀμετάθετον τῶν ὠρισμένων, ἡ μονάς, καὶ ἔστιν αὐτῆς σημεῖον τὸ \dot{M} ἐπίσημον ἔχον τὸ O , \dot{M} .

Ὡσπερ δὲ τῶν ἀριθμῶν τὰ ὁμώνυμα μόρια παρομοίως καλεῖται τοῖς ἀριθμοῖς, τοῦ μὲν τρία τὸ τρίτον, τοῦ δὲ τέσσαρα τὸ τέταρτον, οὕτως καὶ τῶν νῦν ἐπονομασθέντων ἀριθμῶν τὰ ὁμώνυμα μόρια κληθήσεται παρομοίως τοῖς ἀριθμοῖς.

τοῦ μὲν ἀριθμοῦ	τὸ ἀριθμοστόν,
τῆς δὲ δυνάμεως	τὸ δυναμοστόν,
τοῦ δὲ κύβου	τὸ κυβοστόν,
τῆς δὲ δυναμοδυνάμεως	τὸ δυναμοδυναμοστόν,
τοῦ δὲ δυναμοκύβου	τὸ δυναμοκυβοστόν,
τοῦ δὲ κυβοκύβου	τὸ κυβοκυβοστόν.

ἔξει δὲ ἕκαστον αὐτῶν ἐπὶ τὸ τοῦ ὁμωνύμου ἀριθμοῦ σημεῖον γραμμὴν χ διαστέλλουσαν τὸ εἶδος.

* I am entirely convinced by Heath's argument, based on the Bodleian ms. of Diophantus and general considerations, that this symbol is really the first two letters of ἀριθμός; this suggestion brings the symbol into line with Diophantus's abbreviations for δύναμις, κύβος, and so on. It may be declined throughout its cases, e.g., $\xi\acute{\omega}\nu$ for the genitive plural, *infra* p. 552, line 5.

Diophantus has only one symbol for an unknown quantity, but his problems often lead to subsidiary equations involving other unknowns. He shows great ingenuity in isolating these subsidiary unknowns. In the translation I shall use

ALGEBRA : DIOPHANTUS

The number which has none of these characteristics, but merely has in it an undetermined multitude of units, is called *arithmos*, and its sign is $\Xi [x]$.^a

There is also another sign denoting the invariable element in determinate numbers, the unit, and its sign is M with the index O, that is $\overset{\circ}{M}$.

As in the case of numbers the corresponding fractions are called after the numbers, a *third* being called after 3 and a *fourth* after 4, so the functions named above will have reciprocals called after them :

<i>arithmos</i> $[x]$	<i>arithmoston</i> $\left[\frac{1}{x}\right]$,
<i>dynamis</i> $[x^2]$	<i>dynamoston</i> $\left[\frac{1}{x^2}\right]$,
<i>cubus</i> $[x^3]$	<i>cuboston</i> $\left[\frac{1}{x^3}\right]$,
<i>dynamodynamis</i> $[x^4]$	<i>dynamodynamoston</i> $\left[\frac{1}{x^4}\right]$,
<i>dynamocubus</i> $[x^5]$	<i>dynamocuboston</i> $\left[\frac{1}{x^5}\right]$,
<i>cubocubus</i> $[x^6]$	<i>cubocuboston</i> $\left[\frac{1}{x^6}\right]$.

And each of these will have the same sign as the corresponding process, but with the mark \times to distinguish its nature.^b

different letters for the different unknowns as they occur, for example, x, z, m .

Diophantus does not admit negative or zero values of the unknown, but positive fractional values are admitted.

^b So the symbol is printed by Tannery, but there are many variants in the mss.

Ibid. i., Praef., Dioph. ed. Tannery i. 14. 11-20

Μετὰ δὲ ταῦτα ἐὰν ἀπὸ προβλήματός τινος γένηται εἶδη τινὰ ἴσα εἶδεσι τοῖς αὐτοῖς, μὴ ὁμοπληθῇ δέ, ἀπὸ ἐκατέρων τῶν μερῶν δεήσῃ ἀφαιρεῖν τὰ ὅμοια ἀπὸ τῶν ὁμοίων, ἕως ἂν ἐν εἶδος ἐνὶ εἶδει ἴσον γένηται. ἐὰν δέ πως ἐν ὁποτέρῳ ἐνυπάρχη ἢ ἐν ἀμφοτέροις ἐν ἐλλείψεσί τινα εἶδη, δεήσῃ προσθεῖναι τὰ λείποντα εἶδη ἐν ἀμφοτέροις τοῖς μέρεσιν, ἕως ἂν ἐκατέρων τῶν μερῶν τὰ εἶδη ἐνυπάρχοντα γένηται, καὶ πάλιν ἀφελεῖν τὰ ὅμοια ἀπὸ τῶν ὁμοίων, ἕως ἂν ἐκατέρῳ τῶν μερῶν ἐν εἶδος καταλειφθῇ.

^a Lit. "a deficiency multiplied by a deficiency makes a forthcoming."

^b The sign has nothing to do with Ψ', but I see no reason why Diophantus should not have described it by means of Ψ,

ALGEBRA : DIOPHANTUS

Ibid. i., Preface, Dioph. ed. Tannery i. 12. 19-21

A *minus* multiplied by a *minus* makes a *plus*,^a a *minus* multiplied by a *plus* makes a *minus*, and the sign of a *minus* is a truncated Ψ turned upside down, that is Λ .^b

(c) DETERMINATE EQUATIONS

(i.) *Pure* ^c *Determinate Equations*

Ibid. i., Preface, Dioph. ed. Tannery i. 14. 11-20

Next, if there result from a problem an equation in which certain terms are equal to terms of the same species, but with different coefficients, it will be necessary to subtract like from like on both sides until one term is found equal to one term. If perchance there be on either side or on both sides any negative terms, it will be necessary to add the negative terms on both sides, until the terms on both sides become positive, and again to subtract like from like until on each side one term only is left.^d

and cannot agree with Heath (*H.G.M.* ii. 450) that "the description is evidently interpolated." But Heath seems right in his conjecture, first made in 1885, that the sign Λ is a compendium for the root of the verb $\lambdaείπειν$, and is, in fact, a Λ with an I placed in the middle. When the sign is resolved in the manuscripts into a word, the dative $\lambdaείψει$ is generally used, but there is no conclusive proof that Diophantus himself used this non-classical form.

^a A *pure* equation is one containing only one power of the unknown, whatever its degree; a *mixed* equation contains more than one power of the unknown.

^d In modern notation, Diophantus manipulates the equation until it is of the form $Ax^n = B$; as he recognizes only one value of x satisfying this equation, it is then considered solved.

ALGEBRA : DIOPHANTUS

(ii.) Quadratic Equations ^a

Ibid. iv. 39, Dioph. ed. Tannery i. 298. 7-306. 8

To find three numbers such that the difference of the greatest and the middle has to the difference of the middle and the least a given ratio, and further such that the sum of any two is a square.

Let it be laid down that the difference of the greatest and the middle has to the difference of the middle and the least the ratio 3 : 1.

Since the sum of the middle term and the least makes a square, let it be 4. Then the middle term > 2 . Let it be $x + 2$. Then the least term $= 2 - x$.

And since the difference of the greatest and the middle has to the difference of the middle and the least the ratio 3 : 1, and the difference of the middle and the least is $2x$, therefore the difference of the greatest and the middle is $6x$, and therefore the greatest will be $7x + 2$.

There remain two conditions, that the sum of the greatest and the least make a square and the sum of the greatest and the middle make a square. And I am left with the double equation ^b

$$8x + 4 = \text{a square,}$$

$$6x + 4 = \text{a square.}$$

And as the units are squares, the equation is convenient to solve.

^a The quadratic equation takes up only a small part of this problem, but the whole problem will give an excellent illustration of Diophantus's methods, and especially of his ingenuity in passing from one unknown to another. The geometrical solution of quadratic equations by the application of areas is treated in vol. i. pp. 192-215, and Heron's algebraical formula for solving quadratics, *supra*, pp. 502-505.

^b For double equations, *v. infra* p. 543 n. b.

GREEK MATHEMATICS

Πλάσσω ἀριθμούς δύο ἵνα ὁ ὑπ' αὐτῶν ᾖ $\Sigma \beta$, καθὼς ἴσμεν διπλὴν ἰσότητα· ἔστω οὖν $\Sigma \angle'$ καὶ $\dot{M} \delta$. καὶ γίνεται ὁ $\Sigma \dot{M} \rho \iota \beta$. ἐλθὼν ἐπὶ τὰς ὑποστάσεις, οὐ δύναμαι ἀφελεῖν ἀπὸ $\dot{M} \beta$ τὸν $\Sigma \alpha$ τουτέστι τὰς $\dot{M} \rho \iota \beta$. θέλω οὖν τὸν Σ εὐρεθῆναι ἐλάττονα $\dot{M} \beta$, ὥστε καὶ $\Sigma \bar{\epsilon} \dot{M} \delta$ ἐλάσσονες ἔσονται $\dot{M} \bar{\iota} \bar{\epsilon}$. εἰ γὰρ ἡ δυάς ἐπὶ $\Sigma \bar{\epsilon}$ γένηται καὶ προσλάβῃ $\dot{M} \delta$, ποιεῖ $\dot{M} \bar{\iota} \bar{\epsilon}$.

Ἐπεὶ οὖν ζητῶ $\Sigma \eta \dot{M} \delta$ ἴσ. \square^e καὶ $\Sigma \bar{\epsilon} \dot{M} \delta$ ἴσ. \square^e , ἀλλὰ καὶ ὁ ἀπὸ τῆς δυάδος, τουτέστι $\dot{M} \delta$, \square^{es} ἐστι, γεγόνاسι τρεῖς \square^e , $\Sigma \eta \dot{M} \delta$, καὶ $\Sigma \bar{\epsilon} \dot{M} \delta$, καὶ $\dot{M} \delta$, καὶ ἡ ὑπεροχὴ τοῦ μείζονος καὶ τοῦ μέσου τῆς ὑπεροχῆς τοῦ μέσου καὶ τοῦ ἐλαχίστου γ' μέρος ἐστίν. ἀπῆκται οὖν μοι εἰς τὸ εὐρεῖν <τρεῖς>¹ τετραγώνους, ὅπως ἡ ὑπεροχὴ τοῦ μείζονος καὶ τοῦ μέσου τῆς ὑπεροχῆς τοῦ μέσου καὶ τοῦ ἐλαχίστου γ' μέρος ᾖ, ἔτι δὲ ὁ μὲν ἐλάχιστος ᾖ $\dot{M} \delta$, ὁ δὲ μέσος ἐλάσσων $\dot{M} \bar{\iota} \bar{\epsilon}$.

¹ τρεῖς add. Bachet.

^a If we put

$$8x + 4 = (p + q)^2,$$

$$6x + 4 = (p - q)^2,$$

on subtracting,

$$2x = 4pq.$$

Substituting $2p = \frac{1}{2}x$, $2q = 4$ (i.e., $p = \frac{1}{4}x$, $q = 2$) in the first equation we get

$$8x + 4 = (\frac{1}{4}x + 2)^2,$$

or

$$112x = x^2,$$

whence

$$x = 112.$$

ALGEBRA : DIOPHANTUS

I form two numbers whose product is $2x$, according to what we know about a double equation ; let them be $\frac{1}{2}x$ and 4 ; and therefore $x=112$.^a But, returning to the conditions, I cannot subtract x , that is 112 , from 2 ; I desire, then, that x be found <2 , so that $6x+4<16$. For $2 \cdot 6+4=16$.

Then since I seek to make $8x+4=a$ square, and $6x+4=b$ a square, while $2 \cdot 2=4$ is a square, there are three squares, $8x+4$, $6x+4$, and 4 , and the difference of the greatest and the middle is one-third ^b of the difference of the middle and least. My problem therefore resolves itself into finding three squares such that the difference of the greatest and the middle is one-third of the difference of the middle and least, and further such that the least $=4$ and the middle <16 .

This method of solving such equations is explicitly given by Diophantus in ii. 11, Dioph. ed. Tannery i. 96. 8-14: *ἔσται ἄρα ὁ μὲν ς $\alpha\tilde{\alpha}\tilde{\mu}\tilde{\beta}$, ὁ δὲ ς $\alpha\tilde{\alpha}\tilde{\mu}\tilde{\gamma}$, ἴσ.* □· *καὶ τοῦτο τὸ εἶδος καλεῖται διπλοῖσότης· ἰσοῦνται δὲ τὸν τρόπον τοῦτον. ἰδὼν τὴν ὑπεροχὴν, ζήτει δύο ἀριθμοὺς ἵνα τὸ ὑπ' αὐτῶν ποιῇ τὴν ὑπεροχὴν· εἰσὶ δὲ $\tilde{\mu}\tilde{\delta}$ καὶ $\tilde{\mu}^{\circ\sigma}\tilde{\delta}^*$. τούτων ἥτοι τῆς ὑπεροχῆς τὸ $\tilde{\iota}'$ ἐφ' ἑαυτὸ ἴσον ἐστὶ τῷ ἐλάσσονι, ἢ τῆς συνθέσεως τὸ $\tilde{\iota}'$ ἐφ' ἑαυτὸ ἴσον τῷ μείζονι—*“The equations will then be $x+2=a$ square, $x+3=b$ a square ; and this species is called a double equation. It is solved in this manner : observe the difference, and seek two [suitable] numbers whose product is equal to the difference ; they are 4 and $\frac{1}{2}$. Then, either the square of half the difference of these numbers is equated to the lesser, or the square of half the sum to the greater.”

^b The ratio of the differences in this subordinate problem has, of course, nothing to do with the ratio of the differences in the main problem : the fact that they are reciprocals may lead the casual reader to suspect an error.

Τετάρθω ὁ μὲν ἐλάχιστος $\dot{M} \delta$, ἡ δὲ τοῦ μέσου
 - $\pi^{\lambda} \varsigma \bar{\alpha} \dot{M} \beta$. αὐτὸς ἄρα ἔσται ὁ \square^{ω} , $\Delta^{\gamma} \bar{\alpha} \varsigma \delta \dot{M} \delta$.

 \square^{ψ} . πλάσσω \square^{ω} τινὰ ἀπὸ $\dot{M} \bar{\gamma}$ λειπουσῶν ς
 τινας· καὶ γίνεται ὁ ς ἔκ τινος ἀριθμοῦ $\epsilon^{\kappa\iota\varsigma}$ γενο-
 μένου καὶ προσλαβόντος τὸν $\bar{\iota} \beta$, τουτέστι τῆς
 ἰσώσεως τῆς $\varsigma \bar{\iota} \beta$, καὶ μερισθέντος εἰς τὴν ὑπεροχὴν
 ἣ ὑπερέχει ὁ ἀπὸ τοῦ ἀριθμοῦ \square^{ω} τῶν Δ^{γ} τῶν
 ἐν τῇ ἰσώσει $\bar{\gamma}$. ἀπῆκται οὖν μοι εἰς τὸ εὐρεῖν
 τινὰ ἀριθμόν, ὃς $\epsilon^{\kappa\iota\varsigma}$ γενόμενος καὶ προσλαβὼν
 $\dot{M} \bar{\iota} \beta$ καὶ μεριζόμενος εἰς τὴν ὑπεροχὴν ἣ ὑπερέχει
 ὁ ἀπὸ τοῦ αὐτοῦ \square^{ω} τριάδος, ποιεῖ τὴν παραβολὴν
 ἐλάσσονος $\dot{M} \beta$.

ALGEBRA : DIOPHANTUS

Let the least be taken as 4, and the side of the middle as $z+2$; then the square is z^2+4z+4 .

Then since the difference of the greatest and the middle is one-third of the difference of the middle and the least, and the difference of the middle and the least is z^2+4z , so that the difference of the greatest and the least is $\frac{1}{3}z^2+1\frac{1}{3}z$, while the middle term is z^2+4z+4 , therefore the greatest term $= 1\frac{1}{3}z^2+5\frac{1}{3}z+4 = \text{a square}$. Multiply throughout by 9 :

$$12z^2+48z+36 = \text{a square};$$

and take the fourth part :

$$3z^2+12z+9 = \text{a square}.$$

Further, I desire that the middle square < 16 , whence clearly its side < 4 . But the side of the middle square is $z+2$, and so $z+2 < 4$. Take away 2 from each side, and $z < 2$.

My equation is now

$$3z^2+12z+9 = \text{a square}.$$

$$= (mz-3)^2, \text{ say.}^a$$

Then

$$z = \frac{6m+12}{m^2-3},$$

and the equation to which my problem is now resolved is

$$\frac{6m+12}{m^2-3} < 2,$$

i.e.,

$$< \frac{2}{1}.$$

^a As a literal translation of the Greek at this point would be intolerably prolix, I have made free use of modern notation.

GREEK MATHEMATICS

Ἐστω ὁ ζητούμενος $\mathfrak{S} \bar{\alpha}$. οὕτως $\mathfrak{S}^{\kappa\iota\varsigma}$ γενόμενος καὶ προσλαβὼν $\dot{\mathbf{M}} \bar{\iota}\beta$, ποιεῖ $\mathfrak{S} \bar{\mathfrak{S}} \dot{\mathbf{M}} \bar{\iota}\beta$. ὁ δὲ ἀπ' αὐτοῦ $\square^{\circ\varsigma}$, $\Lambda \dot{\mathbf{M}} \bar{\gamma}$, ποιεῖ $\Delta^{\gamma} \bar{\alpha} \Lambda \dot{\mathbf{M}} \bar{\gamma}$. θέλω οὖν $\mathfrak{S} \bar{\mathfrak{S}} \dot{\mathbf{M}} \bar{\iota}\beta$ μερίζεσθαι εἰς $\Delta^{\gamma} \bar{\alpha} \Lambda \dot{\mathbf{M}} \bar{\gamma}$ καὶ ποιεῖν τὴν παραβολὴν ἐλάσσονος $\dot{\mathbf{M}} \bar{\beta}$. ἀλλὰ καὶ ὁ $\bar{\beta}$ μερίζόμενος εἰς $\dot{\mathbf{M}} \bar{\alpha}$, ποιεῖ τὴν παραβολὴν $\bar{\beta}$. ὥστε $\mathfrak{S} \bar{\mathfrak{S}} \dot{\mathbf{M}} \bar{\iota}\beta$ πρὸς $\Delta^{\gamma} \bar{\alpha} \Lambda \dot{\mathbf{M}} \bar{\gamma}$ ἐλάσσονα λόγον ἔχουσιν ἥπερ $\bar{\beta}$ πρὸς $\bar{\alpha}$.

Καὶ χωρίον χωρίῳ ἄνισον. ὁ ἄρα ὑπὸ $\mathfrak{S} \bar{\mathfrak{S}} \dot{\mathbf{M}} \bar{\iota}\beta$ καὶ $\dot{\mathbf{M}} \bar{\alpha}$ ἐλάσσων ἐστὶν τοῦ ὑπὸ δυνάδος καὶ $\Delta^{\gamma} \bar{\alpha} \Lambda \dot{\mathbf{M}} \bar{\gamma}$, τουτέστιν $\mathfrak{S} \bar{\mathfrak{S}} \dot{\mathbf{M}} \bar{\iota}\beta$ ἐλάσσονές εἰσιν $\Delta^{\gamma} \bar{\beta} \Lambda \dot{\mathbf{M}} \bar{\mathfrak{S}}$. καὶ κοιναὶ προσκείσθωσαν αἱ $\dot{\mathbf{M}} \bar{\mathfrak{S}}$. $\mathfrak{S} \bar{\mathfrak{S}} \dot{\mathbf{M}} \bar{\iota}\eta$ ἐλάσσονες $\Delta^{\gamma} \bar{\beta}$.

Ὅταν δὲ τοιαύτην ἴσωσιν ἰσώσωμεν, ποιούμεν τῶν \mathfrak{S} τὸ \angle' ἐφ' ἑαυτό, γίνεται $\bar{\theta}$, καὶ τὰς $\Delta^{\gamma} \bar{\beta}$ ἐπὶ τὰς $\dot{\mathbf{M}} \bar{\iota}\eta$, γίνονται $\bar{\lambda}\mathfrak{S}$. πρόσθετες τοῖς $\bar{\theta}$, γίνονται $\bar{\mu}\epsilon$, ὧν πλ^ς οὐκ ἔλαττον ἐστὶ $\dot{\mathbf{M}} \bar{\zeta}$. πρόσθετες τὸ ἡμίσευμα τῶν \mathfrak{S} (γίνεται οὐκ ἔλαττον $\dot{\mathbf{M}} \bar{\iota}$ καὶ μέρισον εἰς τὰς Δ^{γ}).¹ γίνεται οὐκ ἔλαττον $\dot{\mathbf{M}} \bar{\epsilon}$.

Γέγονεν οὖν μοι $\Delta^{\gamma} \bar{\gamma} \mathfrak{S} \bar{\iota}\beta \dot{\mathbf{M}} \bar{\theta}$ ἴσ. $\square^{\circ\varsigma}$ τῷ ἀπὸ πλ^ς $\dot{\mathbf{M}} \bar{\gamma} \Lambda \mathfrak{S} \bar{\epsilon}$, καὶ γίνεται ὁ \mathfrak{S} $\dot{\mathbf{M}}^{\kappa\beta}_{\mu\beta}$ τουτέστιν $\overset{\iota\alpha}{\kappa\alpha}$.

Τέταχα δὲ τὴν τοῦ μέσου $\square^{\circ\upsilon}$ πλ^ς $\mathfrak{S} \bar{\alpha} \dot{\mathbf{M}} \bar{\beta}$.

¹ γίνεται . . . τὰς Δ^{γ} add. Tannery.

^a This is not strictly true. But since $\sqrt{45}$ lies between 6 and 7, no smaller integral value than 7 will satisfy the conditions of the problem.

ALGEBRA : DIOPHANTUS

The inequality will be preserved when the term are cross-multiplied,

$$\text{i.e.,} \quad (6m + 12) \cdot 1 < 2 \cdot (m^2 - 3);$$

$$\text{i.e.,} \quad 6m + 12 < 2m^2 - 6.$$

By adding 6 to both sides,

$$6m + 18 < 2m^2.$$

When we solve such an equation, we multiply half the coefficient of x [or m] into itself—getting 9; then multiply the coefficient of x^2 into the units— $2 \cdot 18 = 36$; add this last number to the 9—getting 45; take the square root—which is $\sqrt{45}$; add half the coefficient of x —making a number $\sqrt{45} + 10$; and divide the result by the coefficient of x^2 —getting a number $\sqrt{45} \div 2$.^b

My equation is therefore

$$3s^2 + 12s + 9 = \text{a square on side } (3 - 5s),$$

and

$$s = \frac{42}{22} = \frac{21}{11}.$$

I have made the side of the middle square to be

^b This shows that Diophantus had a perfectly general formula for solving the equation

$$ax^2 = bx + c,$$

namely

$$x = \frac{\frac{1}{2}b + \sqrt{\frac{1}{4}b^2 + ac}}{a}.$$

From vi. 6 it becomes clear that he had a similar general formula for solving

$$ax^2 + bx = c,$$

and from v. 10 and vi. 22 it may be inferred that he had a general solution for

$$ax^2 + c = bx.$$

 534

ALGEBRA : DIOPHANTUS

$x+2$; therefore the side will be $\frac{48}{11}$ and the square itself $\frac{1849}{121}$.

I return now to the original problem and make $\frac{1849}{121}$, which is a square, $=6x+4$. Multiplying by 121 throughout, I get $x = \frac{1365}{726}$, which is <2 .

In the conditions of the original problem we made the middle term $=x+2$, the least $=2-x$, and the greatest $7x+2$.

Therefore

$$\text{the greatest} = \frac{11007}{726},$$

$$\text{the middle} = \frac{2817}{726},$$

$$\text{the least} = \frac{87}{726}.$$

Since the denominator, 726, is not a square, but its sixth part is, if we take 121, which is a square, and divide throughout by 6, then similarly the numbers are

$$\begin{array}{ccc} 1834\frac{1}{2} & 469\frac{1}{2} & 14\frac{1}{2} \\ \hline 121 & 121 & 121 \end{array}$$

And if you prefer to use integers only, avoiding the $\frac{1}{2}$, multiply throughout by 4. Then the numbers will be

$$\begin{array}{ccc} 7338 & 1878 & 58 \\ \hline 484 & 484 & 484 \end{array}$$

And the proof is obvious.

^a In general terms, Diophantus's problem is to solve the simultaneous equations

$$\xi + \eta = 2a$$

$$\xi^2 + \eta^2 = A.$$

He says, in effect, let $\xi - \eta = 2x$;

then $\xi = a + x, \eta = a - x,$

ALGEBRA : DIOPHANTUS

(iii.) *Simultaneous Equations Leading to a Quadratic*

Ibid. i. 28, Dioph. ed. Tannery i. 62. 20-64. 10

To find two numbers such that their sum and the sum of their squares are given numbers.^a

It is a necessary condition that double the sum of their squares exceed the square of their sum by a square. This is of the nature of a formula.^b

Let it be required to make their sum 20 and the sum of their squares 208.

Let their difference be $2x$, and let the greater $= x + 10$ (again adding half the sum) and the lesser $= 10 - x$.

Then again their sum is 20 and their difference $2x$.

It remains to make the sum of their squares 208. But the sum of their squares is $2x^2 + 200$.

Therefore $2x^2 + 200 = 208$,

and $x = 2$.

To return to the hypotheses—the greater $= 12$ and the lesser $= 8$. And these satisfy the conditions of the problem.

and $(a+x)^2 + (a-x)^2 = A$,

i.e., $2(a^2 + x^2) = A$.

A procedure equivalent to the solution of the pair of simultaneous equations $\xi + \eta = 2a$, $\xi\eta = A$, is given in i. 27, and a procedure equivalent to the solution of $\xi - \eta = 2a$, $\xi\eta = A$, in i. 30.

^b In other words, $2(\xi^2 + \eta^2) - (\xi + \eta)^2 = a$ square; it is, in fact, $(\xi - \eta)^2$. I have followed Heath in translating *ἐστὶ καὶ τοῦτο πλασματικόν* as "this is of the nature of a formula." Tannery evades the difficulty by translating "est et hoc formativum," but Bachet came nearer the mark with his "effictum aliunde." The meaning of *πλασματικόν* should be "easy to form a mould," i.e. the formula is easy to discover.

(iv.) Cubic Equation

ALGEBRA : DIOPHANTUS

(iv.) Cubic Equation ^a

Ibid. vi. 17, Dioph. ed. Tannery i. 432. 19-434. 22

To find a right-angled triangle such that its area, added to one of the perpendiculars, makes a square, while its perimeter is a cube.

Let its area = x , and let its hypotenuse be some square number minus x , say $16 - x$.

But since we supposed the area = x , therefore the product of the sides about the right angle = $2x$. But $2x$ can be factorized into x and 2 ; if, then, we make one of the sides about the right angle = 2 , the other = x .

The perimeter then becomes 18, which is not a cube; but 18 is made up of a square $[16] + 2$. It shall be required, therefore, to find a square number which, when 2 is added, shall make a cube, so that the cube shall exceed the square by 2.

Let the side of the square = $m + 1$ and that of the cube $m - 1$. Then the square = $m^2 + 2m + 1$ and the cube = $m^3 + 3m - 3m^2 - 1$. Now I want the cube to exceed the square by 2. Therefore, by adding 2 to the square,

$$m^2 + 2m + 3 = m^3 + 3m - 3m^2 - 1,$$

whence

$$m = 4.$$

Therefore the side of the square = 5 and that of

^a This is the only example of a cubic equation solved by Diophantus. For Archimedes' geometrical solution of a cubic equation, *v. supra*, pp. 126-163.

κύβου $\dot{M} \gamma$. αὐτοὶ ἄρα ὁ μὲν $\square^{\circ\circ} \dot{M} \overline{\kappa\epsilon}$, ὁ δὲ κύβος $\dot{M} \overline{\kappa\zeta}$.

Μεθυφίσταμαι οὖν τὸ ὀρθογώνιον, καὶ τάξας αὐτοῦ τὸ ἐμβαδὸν $\mathfrak{S} \bar{a}$, τάσσω τὴν ὑποτείνουσαν $\dot{M} \overline{\kappa\epsilon} \Lambda \mathfrak{S} \bar{a}$. μένει δὲ καὶ ἡ βάσις $\dot{M} \beta$, ἡ δὲ κάθετος $\mathfrak{S} \bar{a}$.

Λοιπὸν ἐστὶν τὸν ἀπὸ τῆς ὑποτείνουσας ἴσον εἶναι τοῖς ἀπὸ τῶν περὶ τὴν ὀρθήν· γίγεται δὲ $\Delta^{\gamma} \bar{a} \dot{M} \overline{\chi\kappa\epsilon} \Lambda \mathfrak{S} \bar{\nu}$. ἔσται ἴση $\Delta^{\gamma} \bar{a} \dot{M} \delta$. ὅθεν ὁ $\mathfrak{S} \dot{M}^{\nu}$ $\chi\kappa\alpha$.

Ἐπὶ τὰς ὑποστάσεις καὶ μένει.

^a Diophantus makes no mention of indeterminate equations of the first degree, presumably because he admits

ALGEBRA : DIOPHANTUS

the cube = 3 ; and hence the square is 25 and the cube 27.

I now transform the right-angled [triangle], and, assuming its area to be x , I make the hypotenuse = $25 - x$; the base remains = 2 and the perpendicular = x .

The condition is still left that the square on the hypotenuse is equal to the sum of the squares on the sides about the right angle ;

$$\text{i.e.,} \quad x^2 + 625 - 50x = x^2 + 4,$$

$$\text{whence} \quad x = \frac{621}{50}.$$

This satisfies the conditions.

(d) INDETERMINATE EQUATIONS ^a

(i.) Indeterminate Equations of the Second Degree

(α) Single Equations

Ibid. ii. 20, Dioph. ed. Tannery i. 114. 11-22

To find two numbers such that the square of either, added to the other, shall make a square.

Let the first be x , and the second $2x + 1$, in order that the square on the first, added to the second, may make a square. There remains to be satisfied the condition that the square on the second, added to the first, shall make a square. But the square on the second, added to the first, is $4x^2 + 5x + 1$; and therefore this must be a square.

rational *fractional* solutions, and the whole point of solving an indeterminate equation of the first degree is to get a solution in integers.

GREEK MATHEMATICS

 ἴσ. $\square^{\circ\circ}$. καὶ $\dot{M}\eta\Lambda\varepsilon\gamma$ ἴσ. $\square^{\circ\circ}$. καὶ οὐ ῥητόν

* The problem, in its most general terms, is to solve the equation

$$Ax^2 + Bx + C = y^2,$$

Diophantus does not give a general solution, but takes a number of special cases. In this case A is a square number ($=a^2$, say), and in the equation

$$a^2x^2 + Bx + C = y^2$$

he apparently puts

$$y^2 = (ax - m)^2,$$

where m is some integer,

whence

$$x = \frac{m^2 - C}{2am + B}.$$

ALGEBRA : DIOPHANTUS

I form the square from $2x-2$; it will be $4x^2 + 4 - 8x$; and $x = \frac{3}{13}$.

The first number will be $\frac{3}{13}$, the second $\frac{19}{13}$, and they satisfy the conditions of the problem.^a

(β) Double Equations ^b

Ibid. iv. 32, Dioph. ed. Tannery 268. 18-272. 15

To divide a given number into three parts such that the product of the first and second \pm the third shall make a square.

Let the given number be 6.

Let the third part be x , and the second part any number < 6 , say 2; then the first part $= 4 - x$; and the two remaining conditions are that the product of the first and second \pm the third $=$ a square. There results the double equation

$$8 - x = a \text{ square,}$$

$$8 - 3x = a \text{ square.}$$

And this does not give a rational result since the ratio

^b Diophantus's term^c for a double equation is διπλοϊσότης, διπλή ισότης or διπλή ἰσώσεις. It always means with him that two different functions of the unknown have to be made simultaneously equal to two squares. The general equations are therefore

$$A_1x^2 + B_1x + C_1 = u_1^2,$$

$$A_2x^2 + B_2x + C_2 = u_2^2.$$

Diophantus solves several examples in which the terms in x^2 are missing, and also several forms of the general equation.

ἔστι διὰ τὸ μὴ εἶναι τοὺς Σ πρὸς ἀλλήλους λόγον ἔχοντας ὃν $\square^{\circ\sigma}$ ἀριθμὸς πρὸς $\square^{\circ\nu}$ ἀριθμόν.

Ἀλλὰ ὁ Σ ὁ \bar{a} μονάδι ἐλάσσων τοῦ β , οἱ δὲ Σ $\bar{\gamma}$ ὁμοίως μείζονες \dot{M} τοῦ β . ἀπῆκται οὖν μοι εἰς τὸ εὐρεῖν ἀριθμόν τινα, ὡς τὸν β , ἵνα ὁ \dot{M} αὐτοῦ μείζων, πρὸς τὸν \dot{M} (αὐτοῦ ἐλάσσονα, λόγον ἔχῃ ὃν $\square^{\circ\sigma}$ ἀριθμὸς πρὸς) $\square^{\circ\nu}$ ἀριθμόν.

Ἐστω ἡ ζητούμενος $\Sigma \bar{a}$, καὶ ὁ \dot{M} \bar{a} αὐτοῦ μείζων ἔσται $\Sigma \bar{a} \dot{M} \bar{a}$, ὁ δὲ \dot{M} αὐτοῦ ἐλάσσων $\Sigma \bar{a} \Lambda \dot{M} \bar{a}$. θέλομεν οὖν αὐτοὺς πρὸς ἀλλήλους λόγον ἔχειν ὃν $\square^{\circ\sigma}$ ἀριθμὸς πρὸς $\square^{\circ\nu}$ ἀριθμόν. ἔστω ὃν δ πρὸς \bar{a} . ὥστε $\Sigma \bar{a} \Lambda \dot{M} \bar{a}$ ἐπὶ $\dot{M} \delta$ γίνονται $\Sigma \delta \Lambda \dot{M} \delta$. καὶ $\Sigma \bar{a} \dot{M} \bar{a}$ ἐπὶ τὴν $\dot{M} \bar{a}$ (γίνονται $\Sigma \bar{a} \dot{M} \bar{a}$).² καὶ εἰσιν οὗτοι οἱ ἐκκείμενοι ἀριθμοὶ λόγον ἔχοντες πρὸς ἀλλήλους ὃν ἔχει $\square^{\circ\sigma}$ ἀριθμὸς πρὸς $\square^{\circ\nu}$ ἀριθμόν. νῦν $\Sigma \delta \Lambda \dot{M} \delta$ ἴσ. $\Sigma \bar{a} \dot{M} \bar{a}$, καὶ γίνεται ὁ $\Sigma \dot{M} \gamma_{\epsilon}$.

Τάσσω οὖν τὸν $\beta^{\circ\nu}$. $\dot{M} \gamma_{\epsilon}$. ὁ γὰρ $\gamma^{\circ\sigma}$ ἐστὶν $\Sigma \bar{a}$. ὁ ἄρα $\alpha^{\circ\sigma}$ ἔσται $\dot{M} \gamma_{\epsilon} \Lambda \Sigma \bar{a}$.

Λοιπὸν δεῖ εἶναι τὸ ἐπίταγμα, ἔστω τὸν ὑπὸ $\alpha^{\circ\nu}$ καὶ $\beta^{\circ\nu}$, προσλαβόντα τὸν $\gamma^{\circ\nu}$, ποιεῖν $\square^{\circ\nu}$, καὶ λείψαντα τὸν $\gamma^{\circ\nu}$, ποιεῖν $\square^{\circ\nu}$. ἀλλ' ὁ ὑπὸ $\alpha^{\circ\nu}$ καὶ $\beta^{\circ\nu}$, προσλαβὼν τὸν $\gamma^{\circ\nu}$, ποιεῖ $\dot{M}^{\theta}_{\xi\epsilon} \Lambda \Sigma \omega'$ ἴσ. $\square^{\circ\psi}$.

Λ δὲ τοῦ $\gamma^{\circ\nu}$, ποιεῖ $\dot{M}^{\theta}_{\xi\epsilon} \Lambda \Sigma \beta \omega'$ ἴσ. $\square^{\circ\psi}$. καὶ

of the coefficients of x is not the ratio of a square to a square.

But the coefficient 1 of x is $2-1$ and the coefficient 3 of x likewise is $2+1$; therefore my problem resolves itself into finding a number to take the place of 2 such that (the number $+1$) bears to (the number -1) the same ratio as a square to a square.

Let the number sought be y ; then (the number $+1$) $= y+1$, and (the number -1) $= y-1$. We require these to have the ratio of a square to a square, say $4:1$. Now $(y-1) \cdot 4 = 4y-4$ and $(y+1) \cdot 1 = y+1$. And these are the numbers having the ratio of a square to a square. Now I put

$$4y-4 = y+1,$$

giving $y = \frac{5}{3}.$

Therefore I make the second part $\frac{5}{3}$, for the third $= x$; and therefore the first $= \frac{13}{3} - x$.

There remains the condition, that the product of the first and second \pm the third $=$ a square. But the product of the first and second $+$ the third $=$

$$\frac{65}{9} - \frac{2}{3}x = \text{a square},$$

and the product of the first and second $-$ the third $=$

$$\frac{65}{9} - 2\frac{2}{3}x = \text{a square}.$$

Ἐπὶ τὰς ὑποστάσεις. ἔσται ὁ μὲν $\alpha^{\circ \varsigma} \bar{\epsilon}$, ὁ δὲ
 $\beta^{\circ \varsigma} \bar{\epsilon}$, ὁ δὲ $\gamma^{\circ \varsigma} \bar{\eta}$. καὶ ἡ ἀπόδειξις φανερά.

^a These are a pair of equations of the form

$$am^2x + a = u^2,$$

$$an^2x + b = v^2.$$

Multiply by n^2 , m^2 respectively, getting, say

$$am^2n^2x + an^2 = u'^2,$$

$$am^2n^2x + bn^2 = v'^2.$$

$$\therefore an^2 - bm^2 = u'^2 - v'^2.$$

Let

$$an^2 - bm^2 = pq,$$

and put

$$u' + v' = p,$$

$$u' - v' = q;$$

$$\therefore u'^2 = \frac{1}{4}(p+q)^2, v'^2 = \frac{1}{4}(p-q)^2,$$

and so

$$am^2n^2x + an^2 = \frac{1}{4}(p+q)^2,$$

$$am^2n^2x + bm^2 = \frac{1}{4}(p-q)^2;$$

whence, from either,

$$x = \frac{\frac{1}{4}(p+q)^2 - \frac{1}{4}(an^2 + bm^2)}{am^2n^2}.$$

ALGEBRA : DIOPHANTUS

Multiply throughout by 9, getting

$$65 - 6x = \text{a square}$$

and

$$65 - 24x = \text{a square.}^a$$

Equating the coefficients of x by multiplying the first equation by 4, I get

$$260 - 24x = \text{a square}$$

and

$$65 - 24x = \text{a square}$$

Now I take their difference, which is 195, and split it into the two factors 15 and 13. Squaring the half of their difference, and equating the result to the lesser square, I get $x = \frac{8}{3}$.

Returning to the conditions—the first part will be $\frac{5}{3}$, the second $\frac{5}{3}$, and the third $\frac{8}{3}$. And the proof is obvious.

This is the procedure indicated by Diophantus. In his example,

$$p = 15, q = 13,$$

and

$$\frac{1}{2}(15 - 13)^2 = 65 - 24x,$$

whence

$$24x = 64, \text{ and } x = \frac{8}{3}$$

* As with equations of the second degree, these may be single or double. Since equations always take the form that an expression in x , of a degree not exceeding the sixth, is to be made equal to a square or cube. The general form is therefore

$$A_0x^6 + A_1x^5 + \dots + A_6 = y^2 \text{ or } y^3.$$

Diophantus solves a number of special cases of different degrees.

In double equations, one expression is made equal to a

ALGEBRA : DIOPHANTUS

(ii.) *Indeterminate Equations of Higher Degree*^a

Ibid. iv. 18, Dioph. ed. Tannery i. 226, 2-228. 5

To find two numbers such that the cube of the first added to the second shall make a cube, and the square of the second added to the first shall make a square.

Let the first number be x . Then the second will be a cube number less x^3 , say $8 - x^3$. And the cube of the first, added to the second, makes a cube.

There remains the condition that the square on the second, added to the first, shall make a square. But the square on the second, added to the first, is $x^6 + x + 64 - 16x^3$. Let this be equal to $(x^3 + 8)^2$, that is to $x^6 + 16x^3 + 64$.^b Then, by adding or subtracting like terms,

$$32x^3 = x;$$

and, after dividing by x ,

$$32x^2 = 1.$$

Now 1 is a square, and if $32x^2$ were a square, my equation would be soluble. But $32x^2$ is formed from $2 \cdot 16x^3$, and $16x^3$ is $(2 \cdot 8)(x^3)$, that is, it is formed

cube and the other to a square, but only a few simple cases are solved by Diophantus.

^b The general type of the equation is

$$x^6 - Ax^3 + Bx + c^2 = y^2.$$

Put $y = x^3 + c$, then

$$x^2 = \frac{B}{A + 2c},$$

and if the right-hand expression is a square, there is a rational solution.

In the case of the equation $x^6 - 16x^3 + x + 64 = y^2$ it is not a square, and Diophantus replaces the equation by another, $x^6 - 128x^3 + x + 4096 = y^2$, in which it is a square.

(e) THEORY OF NUMBERS : SUMS OF SQUARES

Ibid. ii. 8, Dioph. ed. Tannery i. 90. 9-21

Τὸν ἐπιταχθέντα τετράγωνον διελεῖν εἰς δύο
τετραγώνους.

" It was on this proposition that Fermat wrote a famous note: "On the other hand, it is impossible to separate a cube into two cubes, or a biquadrate into two biquadrates, or generally any power except a square into two powers with the same exponent. I have discovered a truly marvellous proof of this, which, however, the margin is too narrow to contain."
550

ALGEBRA : DIOPHANTUS

from 2. 8. Therefore $32x^2$ is formed from 4. 8. My problem therefore becomes to find a cube which, when multiplied by 4, makes a square.

Let the number sought be y^3 . Then $4y^3 = \text{a square} = 16y^2$ say; whence $y = 4$. Returning to the conditions—the cube will be 64.

I therefore take the second number as $64 - x^3$. There remains the condition that the square on the second added to the first shall make a square. But the square on the second added to the first =

$$\begin{aligned} x^6 + 4096 + x - 128x^3 &= \text{a square} \\ &= (x^3 + 64)^2, \text{ say,} \\ &= x^6 + 4096 + 128x^3. \end{aligned}$$

On taking away the common terms,

$$256x^3 = x,$$

and
$$x = \frac{1}{16}.$$

Returning to the conditions—

$$\text{first number} = \frac{1}{16}, \text{ second number} = \frac{262143}{4096}.$$

(e) THEORY OF NUMBERS : SUMS OF SQUARES

It is necessary that the given number be neither 2 nor any multiple of 8 increased by 2.^b

Let it be required to divide unity into three parts such that, when 3 is added to each, the results shall all be squares.

numbers not of this form which also are not the sum of three squares. Fermat showed that, if $3a + 1$ is the sum of three squares, then it cannot be of the form $4^n (24k + 7)$ or $4^n (8k + 7)$, where $k=0$ or any integer.

Πάλιν δεῖ τὸν $\bar{\iota}$ διελεῖν εἰς τρεῖς $\square^{\text{ου}}$ ὅπως ἕκαστος αὐτῶν μείζων ἢ $\bar{M} \bar{\gamma}$. ἐὰν οὖν πάλιν τὸν $\bar{\iota}$ διέλωμεν εἰς τρεῖς $\square^{\text{ου}}$, τῇ τῆς παρισότητος ἀγωγῇ, ἔσται ἕκαστος αὐτῶν μείζων τριάδος καὶ δυνησόμεθα, ἀφ' ἐκάστου αὐτῶν ἀφελόντες $\bar{M} \bar{\gamma}$, ἔχειν εἰς οὓς ἡ \bar{M} διαιρεῖται.

Λαμβάνομεν ἄρτι τοῦ $\bar{\iota}$ τὸ $\gamma^{\text{ου}}$, γί. $\bar{\gamma} \gamma^{\text{x}}$, καὶ ζητοῦμεν τί προστιθέντες μόριον τετραγωνικὸν ταῖς $\bar{M} \bar{\gamma} \gamma^{\text{x}}$, ποιήσομεν $\square^{\text{ου}}$. πάντα θκς. δεῖ καὶ τῷ $\bar{\lambda}$ προσθεῖναι τι μόριον τετραγωνικὸν καὶ ποιεῖν τὸν ὅλον $\square^{\text{ου}}$.

Ἐστω τὸ προστιθέμενον μόριον $\Delta^{\text{v}} \times \bar{a}$. καὶ πάντα ἐπὶ Δ^{v} . γίνονται $\Delta^{\text{v}} \bar{\lambda} \bar{M} \bar{a} \bar{\iota}\sigma$. $\square^{\text{ου}}$. τῷ ἀπὸ πλευρᾶς $\bar{s} \bar{\epsilon} \bar{M} \bar{a}$. γίνεται ὁ $\square^{\text{ου}}$ $\Delta^{\text{v}} \bar{\kappa} \bar{\epsilon} \bar{s} \bar{\iota} \bar{M} \bar{a} \bar{\iota}\sigma$. $\Delta^{\text{v}} \bar{\lambda} \bar{M} \bar{a}$. ὅθεν ὁ $\bar{s} \bar{M} \bar{\beta}$, ἢ $\Delta^{\text{v}} \bar{M} \bar{\delta}$, τὸ $\Delta^{\text{v}} \times \bar{M} \bar{\delta} \times$.

Εἰ οὖν ταῖς $\bar{M} \bar{\lambda}$ προστίθεται $\bar{M} \bar{\delta} \times$, ταῖς $\bar{M} \bar{\gamma} \gamma^{\text{x}}$ προστεθήσεται $\lambda \varsigma^{\text{x}}$ καὶ γίνεται $\lambda \varsigma^{\text{x}}$. δεῖ οὖν τὸν $\bar{\iota}$ διελεῖν εἰς τρεῖς $\square^{\text{ου}}$ ὅπως ἐκάστου $\square^{\text{ου}}$ ἡ πλευρὰ πάριςος ἢ $\bar{M} \bar{\iota}^{\text{α}}$.

Ἀλλὰ καὶ ὁ $\bar{\iota}$ σύγκειται ἐκ δύο $\square^{\text{ου}}$, τοῦ τε $\bar{\theta}$ καὶ τῆς \bar{M} . διαιροῦμεν τὴν \bar{M} εἰς δύο $\square^{\text{ου}}$ τὰ τε $\bar{\kappa} \bar{\epsilon} \bar{\theta}$ καὶ τὰ $\bar{\kappa} \bar{\epsilon} \bar{\iota}$, ὥστε τὸν $\bar{\iota}$ συγκεῖσθαι ἐκ τριῶν $\square^{\text{ου}}$,

^a The method has been explained in v. 19, where it is proposed to divide 13 into two squares each > 6. It will be sufficiently obvious from this example. The method is also used in v. 10, 12, 13, 14.

ALGEBRA : DIOPHANTUS

Then it is required to divide 10 into three squares such that each of them > 3 . If then we divide 10 into three squares, according to the method of approximation,^a each of them will be > 3 and, by taking 3 from each, we shall be able to obtain the parts into which unity is to be divided.

We take, therefore, the third part of 10, which is $3\frac{1}{3}$, and try by adding some square part to $3\frac{1}{3}$ to make a square. On multiplying throughout by 9, it is required to add to 30 some square part which will make the whole a square.

Let the added part be $\frac{1}{x^2}$; multiply throughout by x^2 ; then

$$30x^2 + 1 = \text{a square.}$$

Let the root be $5x + 1$; then, squaring,

$$25x^2 + 10x + 1 = 30x^2 + 1;$$

whence

$$x = 2, x^2 = 4, \frac{1}{x^2} = \frac{1}{4}.$$

If, then, to 30 there be added $\frac{1}{4}$, to $3\frac{1}{3}$ there is added $\frac{1}{36}$, and the result is $\frac{121}{36}$. It is therefore required to divide 10 into three squares such that the side of each shall approximate to $\frac{11}{6}$.

But 10 is composed of two squares, 9 and 1. We divide 1 into two squares, $\frac{9}{25}$ and $\frac{16}{25}$, so that 10 is composed of three squares, 9, $\frac{9}{25}$ and $\frac{16}{25}$. It is there-

ἐκ τε τοῦ $\bar{\theta}$ καὶ τοῦ $\frac{\kappa\epsilon}{\iota\varsigma}$ καὶ τοῦ $\frac{\kappa\epsilon}{\theta}$. δεῖ οὖν ἐκά-
στην τῶν π^{λ} · τούτων παρασκευάσαι πάρισον $\frac{5}{\iota\alpha}$.

οἱ ἀπὸ τῶν εἰρημένων \square^{α} , Δ^{γ} , $\gamma\phi\nu\epsilon\bar{M}\bar{\iota}\bar{\Lambda}\bar{\varsigma}\bar{\rho}\bar{\iota}\bar{\varsigma}$.
ταῦτα ἴσα $\bar{M}\bar{\iota}$. ὅθεν εὐρίσκεται ὁ $\bar{\varsigma}\bar{\gamma}\phi\nu\epsilon$.

Ἐπὶ τὰς ὑποστάσεις· καὶ γίνονται αἱ πλευραὶ
τῶν τετραγώνων δοθεῖσαι, ὥστε καὶ αὐτοί. τὰ
λοιπὰ δῆλα.

Ibid. iv. 29, Dioph. ed. Tannery i. 258. 19-260. 16

Εὐρεῖν τέσσαρας ἀριθμοὺς <τετραγώνους>, οἳ
συντεθέντες καὶ προσλαβόντες τὰς ἰδίας πλευρὰς
συντεθείσας ποιοῦσι δοθέντα ἀριθμόν.

^a The sides are, in fact, $\frac{1321}{711}$, $\frac{1288}{711}$, $\frac{1285}{711}$, and the squares
are $\frac{1745011}{505521}$, $\frac{1658944}{505521}$, $\frac{1651225}{505521}$.

ALGEBRA : DIOPHANTUS

fore required to make each of the sides approximate to $\frac{11}{6}$.

But their sides are $3, \frac{4}{5}$ and $\frac{3}{5}$. Multiply throughout by 30, getting 90, 24 and 18; and $\frac{11}{6}$ [when multiplied by 30] becomes 55. It is therefore required to make each side approximate to 55.

[Now $3 > \frac{55}{30}$ by $\frac{35}{30}$, $\frac{4}{5} < \frac{55}{30}$ by $\frac{31}{30}$, and $\frac{3}{5} < \frac{55}{30}$ by $\frac{37}{30}$.

If, then, we took the sides of the squares as $3 - \frac{35}{30}$, $\frac{4}{5} + \frac{31}{30}$, $\frac{3}{5} + \frac{37}{30}$, the sum of the squares would be $3 \cdot (\frac{11}{6})^2$ or $\frac{363}{36}$, which > 10 .

Therefore] we take the side of the first square as $3 - 35x$, of the second as $\frac{4}{5} + 31x$, and of the third as $\frac{3}{5} + 37x$. The sum of the aforesaid squares

$$3555x^2 + 10 - 116x = 10;$$

whence $x = \frac{116}{3555}$.

Returning to the conditions—as the sides of the squares are given, the squares themselves are also given. The rest is obvious.^a

Ibid. iv. 29, Dioph. ed. Tannery i. 258. 19-260. 16

To find four square numbers such that their sum added to the sum of their sides shall make a given number.

Ἐστω δὴ τὸν $\overline{\iota\beta}$.

Ἐπεὶ πᾶς $\square^{\circ\sigma}$ προσλαβὼν τὴν ἰδίαν π^{λ} καὶ $\overset{\circ}{M}\delta^{\times}$, ποιεῖ $\square^{\circ\sigma}$, οὗ ἡ $\pi^{\lambda} \cdot \overset{\circ}{M}\angle'$ ποιεῖ ἀριθμὸν τινα, ὅς ἐστι τοῦ ἐξ ἀρχῆς $\square^{\circ\sigma}$ πλευρά, οἱ τέσσαρες ἀριθμοὶ ἄρα, προσλαβόντες μὲν τὰς ἰδίας π^{λ} ποιοῦσι $\overset{\circ}{M}\overline{\iota\beta}$, προσλαβόντες δὲ καὶ δ^{α} , ποιοῦσι τέσσαρας $\square^{\circ\sigma\sigma}$. εἰσὶ δὲ καὶ αἱ $\overset{\circ}{M}\overline{\iota\beta}$ μετὰ $\delta^{\omega\omega}$, ὅ ἐστι $\overset{\circ}{M}\bar{\alpha}$, $\overset{\circ}{M}\bar{\gamma}$. τὰς $\bar{\gamma}$ ἄρα $\overset{\circ}{M}$ διαιρεῖν δεῖ εἰς τέσσαρας $\square^{\circ\sigma\sigma}$, καὶ ἀπὸ τῶν πλευρῶν, ἀφελῶν ἀπὸ ἐκάστης $\pi^{\lambda} \cdot \overset{\circ}{M}\angle'$, ἔξω τῶν $\delta^{\omega\omega}$ τὰς π^{λ} .

Διαιρεῖται δὲ ὁ $\bar{\gamma}$ εἰς δύο $\square^{\circ\sigma\sigma}$, τὸν τε δ^{θ} καὶ θ . καὶ πάλιν ἐκάτερος τούτων διαιρεῖται εἰς δύο $\square^{\circ\sigma\sigma}$, εἰς $\overset{\kappa\epsilon}{\xi\delta}$ καὶ $\overset{\kappa\epsilon}{\lambda\varsigma}$, καὶ $\overset{\kappa\epsilon}{\rho\mu\delta}$ καὶ $\overset{\kappa\epsilon}{\pi\alpha}$. λαβὼν τοίνυν ἐκάστου τὴν πλευράν, $\overset{\epsilon}{\eta}$, $\overset{\epsilon}{\varsigma}$, $\overset{\epsilon}{\iota\beta}$, $\overset{\epsilon}{\theta}$, καὶ αἵρω ἀπὸ ἐκάστου τούτων πλευρᾶς $\overset{\circ}{M}\angle'$, καὶ ἔσονται αἱ π^{λ} τῶν ζητουμένων $\square^{\omega\omega}$, $\overset{\iota}{\iota\alpha}$, $\overset{\iota}{\zeta}$, $\overset{\iota}{\iota\theta}$, $\overset{\iota}{\gamma}$. αὐτοὶ ἄρα οἱ $\square^{\circ\iota}$, ὅς μὲν $\overset{\rho}{\rho\kappa\alpha}$, ὅς δὲ $\overset{\rho}{\mu\theta}$, ὅς δὲ $\overset{\rho}{\tau\xi\alpha}$, ὅς δὲ $\overset{\rho}{\rho\xi\theta}$.

ALGEBRA : DIOPHANTUS

Let it be 12.

Since any square added to its own side and $\frac{1}{4}$ makes a square, whose side *minus* $\frac{1}{2}$ is the number which is the side of the original square,^a and the four numbers added to their own sides make 12, then if we add $4 \cdot \frac{1}{4}$ they will make four squares. But

$$12 + 4 \cdot \frac{1}{4} \text{ (or } 1) = 13.$$

Therefore it is required to divide 13 into four squares, and then, if I subtract $\frac{1}{2}$ from each of their sides, I shall have the sides of the four squares.

Now 13 may be divided into two squares, 4 and 9. And again, each of these may be divided into two squares, $\frac{64}{25}$ and $\frac{36}{25}$, and $\frac{144}{25}$ and $\frac{81}{25}$. I take the side of each $\frac{8}{5}$, $\frac{6}{5}$, $\frac{12}{5}$, $\frac{9}{5}$, and subtract half from each side, and the sides of the required squares will be

$$\frac{11}{10}, \frac{7}{10}, \frac{19}{10}, \frac{13}{10}.$$

The squares themselves are therefore respectively

$$\frac{121}{100}, \frac{49}{100}, \frac{361}{100}, \frac{169}{100}.$$

^a i.e., $x^2 + x + \frac{1}{4} = (x + \frac{1}{2})^2$.

^b In iv. 30 and v. 14 it is also required to divide a number into four squares. As every number is either a square or the sum of two, three or four squares (a theorem stated by Fermat and proved by Lagrange), and a square can always be divided into two squares, it follows that any number can be divided into four squares. It is not known whether Diophantus was aware of this.

(f) POLYGONAL NUMBERS

Dioph. *De polyg. num.*, Praef., Dioph. ed. Tannery
i. 450. 3-19

Ἐκαστος τῶν ἀπὸ τῆς τριάδος ἀριθμῶν αὐξομένων μονάδι, πολύγωνός ἐστι πρῶτος¹ ἀπὸ τῆς μονάδος, καὶ ἔχει γωνίας τοσαύτας ὅσον ἐστὶν τὸ πλῆθος τῶν ἐν αὐτῷ μονάδων· πλευρά τε αὐτοῦ ἐστὶν ὁ ἐξῆς τῆς μονάδος ἀριθμός, ὁ β. ἔσται δὲ ὁ μὲν γ τρίγωνος, ὁ δὲ δ τετράγωνος, ὁ δὲ ε πεντάγωνος, καὶ τοῦτο ἐξῆς.

Τῶν δὲ τετραγώνων προδήλων ὄντων ὅτι καθ-εστήκασι τετράγωνοι διὰ τὸ γεγονέναι αὐτοὺς ἐξ ἀριθμοῦ τινος ἐφ' ἑαυτὸν πολλαπλασιασθέντος, ἐδοκιμάσθη ἕκαστον τῶν πολυγώνων, πολυπλασιαζόμενον ἐπὶ τινὰ ἀριθμὸν κατὰ τὴν ἀναλογίαν τοῦ πλήθους τῶν γωνιῶν αὐτοῦ, καὶ προσλαβόντα τετράγωνόν τινα πάλιν κατὰ τὴν ἀναλογίαν τοῦ πλήθους τῶν γωνιῶν αὐτῶν, φαίνεσθαι τετράγωνον· ὁ δὲ παραστήσομεν ὑποδείξαντες πῶς ἀπὸ δοθείσης πλευρᾶς ὁ ἐπιταχθεὶς πολύγωνος εὐρίσκεται, καὶ πῶς δοθέντι πολυγώνῳ ἡ πλευρὰ λαμβάνεται.

^a A fragment of the tract *On Polygonal Numbers* is the only work by Diophantus to have survived with the *Arithmetica*. The main fact established in it is that stated in Hypsicles' definition, that the α -gonal number of side n is

ALGEBRA : DIOPHANTUS

(f) POLYGONAL NUMBERS ^a

Diophantus, *On Polygonal Numbers*, Preface, Dioph.
ed. Tannery i. 450. 3-19

From 3 onwards, every member of the series of natural numbers increasing by unity is the first (after unity) of a particular species of polygon, and it has as many angles as there are units in it; its side is the number next in order after the unit, that is, 2. Thus 3 will be a triangle, 4 a square, 5 a pentagon, and so on in order.^b

In the case of squares, it is clear that they are squares because they are formed by the multiplication of a number into itself. Similarly it was thought that any polygon, when multiplied by a certain number depending on the number of its angles, with the addition of a certain square also depending on the number of its angles, would also be a square. This we shall establish, showing how any assigned polygonal number may be found from a given side, and how the side may be calculated from a given polygonal number.

$\frac{1}{2}n\{2 + (n-1)(a-2)\}$ (v. *supra*, p. 396 n. a, and vol. i. p. 98 n. a). The method of proof contrasts with that of the *Arithmetica* in being geometrical. For polygonal numbers, v. vol. i. pp. 86-99.

^b The meaning is explained in vol. i. p. 86 n. a, especially in the diagram on p. 87. In the example there given, 5 is the first (after unity) of the series of pentagonal numbers 1, 5, 12, 22 . . . It has 5 angles, and each side joins 2 units.

XXIV. REVIVAL OF GEOMETRY :
PAPPUS OF ALEXANDRIA

XXIV. REVIVAL OF GEOMETRY: PAPPUS OF ALEXANDRIA

(a) GENERAL

Suidas, *s.v.* Πάππος

Πάππος, Ἀλεξανδρεὺς, φιλόσοφος, γεγονὼς κατὰ τὸν πρεσβύτερον Θεοδοσίον τὸν βασιλέα, ὅτε καὶ Θέων ὁ φιλόσοφος ἤκμαζεν, ὁ γράψας εἰς τὸν Πτολεμαίων Κανόνα. βιβλία δὲ αὐτοῦ Χωρογραφία οἰκουμένη, Εἰς τὰ δ' βιβλία τῆς Πτολεμαίου

* Theodosius I reigned from A.D. 379 to 395, but Suidas may have made a mistake over the date. A marginal note opposite the entry *Diocletian* in a Leyden ms. of chronological tables by Theon of Alexandria says, "In his time Pappus wrote"; Diocletian reigned from A.D. 284 to 305. In Rome's edition of Pappus's commentary on Ptolemy's *Syntaxis* (*Studi e Testi*, liv. pp. x-xiii), a cogent argument is given for believing that Pappus actually wrote his *Collection* about A.D. 320.

Suidas obviously had a most imperfect knowledge of Pappus, as he does not mention his greatest work, the *Synagoge* or *Collection*. It is a handbook to the whole of Greek geometry, and is now our sole source for much of the history of that science. The first book and half of the second are missing. The remainder of the second book gives an account of Apollonius's method of working with large numbers (*v. supra*, pp. 352-357). The nature of the remaining books to the eighth will be indicated by the passages here cited. There is some evidence (*v. infra*, p. 607 n. a) that the work was originally in twelve books.

The edition of the *Collection* with ancillary material published in three volumes by Friedrich Hultsch (Berlin, 1876-564

XXIV. REVIVAL OF GEOMETRY: PAPPUS OF ALEXANDRIA

(a) GENERAL

Suidas, s.v. *Pappus*

PAPPUS, an Alexandrian, a philosopher, born in the time of the Emperor Theodosius I, when Theon the philosopher also flourished,^a who commented on Ptolemy's *Table*. His works include a *Universal Geography*, a *Commentary on the Four Books of*

1878) was a notable event in the revival of Greek mathematical studies. The editor's only major fault is one which he shares with his generation, a tendency to condemn on slender grounds passages as interpolated.

Pappus also wrote a commentary on Euclid's *Elements*; fragments on Book x. are believed to survive in Arabic (v. vol. i. p. 456 n. a). A commentary by Pappus on Euclid's *Data* is referred to in Marinus's commentary on that work. Pappus (v. vol. i. p. 301) himself refers to his commentary on the *Analemma* of Diodorus. The Arabic Fihrist says that he commented on Ptolemy's *Planisphaerium*.

The separate books of the *Collection* were divided by Pappus himself into numbered sections, generally preceded by a preface, and the editors have also divided the books into chapters. References to the *Collection* in the selections here given (e.g., *Coll.* iii. 11. 28, ed. Hultsch 68. 17-70. 8) are first to the book, then to the number or preface in Pappus's division, then to the chapter in the editors' division, and finally to the page and line of Hultsch's edition. In the selections from Book vii. Pappus's own divisions are omitted as they are too complicated, but in the collection of lemmas the numbers of the propositions in Hultsch's edition are added as these are often cited.

(b) PROBLEMS AND THEOREMS

Pappus, *Collection* iii., Preface 1, ed. Hultsch 30. 3-32. 3

Those who favour a more exact terminology in the subjects studied in geometry, most excellent Pandrosion, use the term *problem* to mean an inquiry in which it is proposed to do or to construct something, and the term *theorem* an inquiry in which the consequences and necessary implications of certain hypotheses are investigated, but among the ancients some described them all as problems, some as theorems. Therefore he who propounds a theorem, no matter how he has become aware of it, must set for investigation the conclusion inherent in the premises, and in no other way would he correctly propound the theorem; but he who propounds a problem, even though he may require us to construct something which is in some way impossible, is free from blame and criticism. For it is part of the investigator's task to determine the conditions under which a problem is possible and impossible, and, if possible, when, how and in how many ways it is possible. But when a man professing to know mathematics sets an investigation wrongly he is not free from censure. For example, some persons professing to have learnt mathematics from you lately gave me a wrong enunciation of problems. It is desirable that I should state some of the proofs of thirteen books. Pappus's commentary now survives only for Books v. and vi., which have been edited by A. Rome, *Studi e Testi*, liv., but it certainly covered the first six books and possibly all thirteen.

παραπλησίων αὐτοῖς ἀποδείξεις τινὰς ἡμᾶς εἰπεῖν εἰς ὠφέλειαν σὴν τε καὶ τῶν φιλομαθούντων ἐν τῷ τρίτῳ τούτῳ τῆς Συναγωγῆς βιβλίῳ. τὸ μὲν οὖν πρῶτον τῶν προβλημάτων μέγας τις γεωμέτης εἶναι δοκῶν ὥρισεν ἀμαθῶς. τὸ γὰρ δύο δοθεισῶν εὐθειῶν δύο μέσας ἀνάλογον ἐν συνεχεῖ ἀναλογία λαβεῖν ἔφασκεν εἰδέναι δι' ἐπιπέδου θεωρίας, ἡξίου δὲ καὶ ἡμᾶς ὁ ἀνὴρ ἐπισκεψαμένους ἀποκρίνασθαι περὶ τῆς ὑπ' αὐτοῦ γενηθείσης κατασκευῆς, ἥτις ἔχει τὸν τρόπον τοῦτον.

(c) THE THEORY OF MEANS

Ibid. iii. 11. 28, ed. Hultsch 68. 17-70. 8

Τὸ δὲ δεύτερον τῶν προβλημάτων ἦν τόδε·

Ἐν ἡμικυκλίῳ τὰς τρεῖς μεσότητες λαβεῖν ἄλλος τις ἔφασκεν, καὶ ἡμικύκλιον τὸ $ΑΒΓ$ ἐκθέμενος, οὗ κέντρον τὸ $Ε$, καὶ τυχὸν σημεῖον ἐπὶ τῆς $ΑΓ$ λαβὼν τὸ $Δ$, καὶ ἀπ' αὐτοῦ πρὸς ὀρθὰς ἀγαγὼν τῇ $ΕΓ$ τὴν $ΔΒ$, καὶ ἐπιζεύξας τὴν $ΕΒ$, καὶ αὐτῇ κάθετον ἀγαγὼν ἀπὸ τοῦ $Δ$ τὴν $ΔΖ$, τὰς τρεῖς μεσότητες ἔλεγεν ἀπλῶς ἐν τῷ ἡμικυκλίῳ ἐκτεθεῖσθαι, τὴν μὲν $ΕΓ$ μέσσην ἀριθμητικὴν, τὴν δὲ $ΔΒ$ μέσσην γεωμετρικὴν, τὴν δὲ $ΒΖ$ ἀρμονικὴν.

Ὅτι μὲν οὖν ἡ $ΒΔ$ μέσση ἐστὶ τῶν $ΑΔ$, $ΔΓ$ ἐν

* The method, as described by Pappus, but not reproduced here, does not actually solve the problem, but it does furnish a series of successive approximations to the solution, and deserves more kindly treatment than it receives from him.

REVIVAL OF GEOMETRY : PAPPUS

these and of matters akin to them, for the benefit both of yourself and of other lovers of this science, in this third book of the *Collection*. Now the first of these problems was set wrongly by a person who was thought to be a great geometer. For, given two straight lines, he claimed to know how to find by plane methods two means in continuous proportion, and he even asked that I should look into the matter and comment on his construction, which is after this manner.^a

(c) THE THEORY OF MEANS

Ibid. iii. 11. 28, ed. Hultsch 68. 17-70. 8

The second of the problems was this :

A certain other [geometer] set the problem of exhibiting the three means in a semicircle. Describing a semicircle $AB\Gamma$, with centre E , and taking any point Δ on $A\Gamma$, and from it drawing ΔB perpendicular to $E\Gamma$, and joining EB , and from Δ drawing ΔZ perpendicular to it, he claimed simply that the three means had been set out in the semicircle, $E\Gamma$ being the arithmetic mean, ΔB the geometric mean and BZ the harmonic mean.

That $B\Delta$ is a mean between $A\Delta$, $\Delta\Gamma$ in geometrical

τῇ γεωμετρικῇ ἀναλογίᾳ, ἥ δὲ ΕΓ τῶν ΑΔ, ΔΓ ἐν τῇ ἀριθμητικῇ μεσότητι, φανερόν. ἔστι γὰρ ὡς μὲν ἡ ΑΔ πρὸς ΔΒ, ἡ ΔΒ πρὸς ΔΓ, ὡς δὲ ἡ ΑΔ πρὸς ἑαυτὴν, οὕτως ἡ τῶν ΑΔ, ΑΕ ὑπεροχή, τουτέστιν ἡ τῶν ΑΔ, ΕΓ, πρὸς τὴν τῶν ΕΓ, ΓΔ. πῶς δὲ καὶ ἡ ΖΒ μέση ἐστὶν τῆς ἀρμονικῆς μεσότητος, ἣ ποίων εὐθειῶν, οὐκ εἶπεν, μόνον δὲ ὅτι τρίτη ἀνάλογόν ἐστιν τῶν ΕΒ, ΒΔ, ἀγνοῶν ὅτι ἀπὸ τῶν ΕΒ, ΒΔ, ΒΖ ἐν τῇ γεωμετρικῇ ἀναλογίᾳ οὐσῶν πλάσσεται ἡ ἀρμονικὴ μεσότης. δειχθήσεται γὰρ ὑφ' ἡμῶν ὕστερον ὅτι δύο αἱ ΕΒ καὶ τρεῖς αἱ ΔΒ καὶ μία ἡ ΒΖ ὡς μία συντεθεῖσαι ποιοῦσι τὴν μείζονα ἄκραν τῆς ἀρμονικῆς μεσότητος, δύο δὲ αἱ ΒΔ καὶ μία ἡ ΒΖ τὴν μέσην, μία δὲ ἡ ΒΔ καὶ μία ἡ ΒΖ τὴν ἐλαχίστην.

proportion, and $E\Gamma$ between $A\Delta$, $\Delta\Gamma$ in arithmetical proportion, is clear. For

$$\begin{aligned} A\Delta : \Delta B &= \Delta B : \Delta\Gamma, \text{ [Eucl. iii. 31, vi. 8 Por.} \\ \text{and} \quad A\Delta : A\Delta &= (A\Delta - AE) : (E\Gamma - \Gamma\Delta) \\ &= (A\Delta - E\Gamma) : (E\Gamma - \Gamma\Delta). \end{aligned}$$

But how ZB is a harmonic mean, or between what kind of lines, he did not say, but only that it is a third proportional to EB , $B\Delta$, not knowing that from EB , $B\Delta$, BZ , which are in geometrical proportion, the harmonic mean is formed. For it will be proved by me later that a harmonic proportion can thus be formed—

$$\begin{aligned} \text{greater extreme} &= 2EB + 3\Delta B + BZ, \\ \text{mean term} &= 2B\Delta + BZ, \\ \text{lesser extreme} &= B\Delta + BZ.^a \end{aligned}$$

(d) THE PARADOXES OF ERYCINUS

Ibid. iii. 24. 58, ed. Hultsch 104. 14-106. 9

The third of the problems was this :

Let $AB\Gamma$ be a right-angled triangle having the

^a It is Pappus, in fact, who seems to have erred, for BZ is a harmonic mean between $A\Delta$, $\Delta\Gamma$, as can thus be proved :

Since $B\Delta E$ is a right-angled triangle in which ΔZ is perpendicular to BE ,

$$\begin{aligned} \therefore \quad BZ : BA &= BA : BE, \\ \text{i.e.,} \quad BZ \cdot BE &= BA^2 = A\Delta \cdot \Delta\Gamma. \\ \text{But} \quad BE &= \frac{1}{2}(A\Delta + \Delta\Gamma); \\ \therefore \quad BZ(A\Delta + \Delta\Gamma) &= 2A\Delta \cdot \Delta\Gamma. \\ \therefore \quad A\Delta(BZ - \Delta\Gamma) &= \Delta\Gamma(A\Delta - BZ), \\ \text{i.e.,} \quad A\Delta : \Delta\Gamma &= (A\Delta - BZ) : (BZ - \Delta\Gamma), \end{aligned}$$

and $\therefore BZ$ is a harmonic mean between $A\Delta$, $\Delta\Gamma$.

The three means and the several extremes have thus been

Εἰς τὴν δοθείσαν σφαῖραν ἐγγράψαι τὰ πέντε πολύεδρα, προγράφεται δὲ τάδε.

Ἔστω ἐν σφαίρᾳ κύκλος ὁ $ΑΒΓ$, οὗ διάμετρος ἡ $ΑΓ$ καὶ κέντρον τὸ $Δ$, καὶ προκείσθω εἰς τὸν

represented by *five* straight lines ($ΕΒ$, $ΒΖ$, $ΑΔ$, $ΔΓ$, $ΒΔ$). Pappus takes *εἰς* lines to solve the problem. He proceeds to define the seven other means and to form all ten means as linear functions of three terms in geometrical progression (v. vol. i. pp. 124-129).

REVIVAL OF GEOMETRY : PAPPUS

angle B right, and let $A\Delta$ be drawn, and let ΔE be placed equal to AB , then if EA be bisected at Z , and $Z\Gamma$ be joined, to show that the sum of the two sides ΔZ , $Z\Gamma$ within the triangle, is greater than the sum of the two sides BA , $A\Gamma$ without the triangle.

And it is obvious. For

since $\Gamma Z + ZA > \Gamma A$, [Eucl. i. 20

i.e., $\Gamma Z + ZE > \Gamma A$,

while $\Delta E = AB$,

$\therefore \Gamma Z + ZE + E\Delta = \Gamma A + A$

i.e., $\Gamma Z + Z\Delta > \Gamma A + AB$

But it is clear that this type of proposition, according to the different ways in which one might wish to propound it, can take an infinite number of forms, and it is not out of place to discuss such problems more generally and [first] to propound this from the so-called paradoxes of Erycinus.^a

(e) THE REGULAR SOLIDS ^b

Ibid. iii. 40. 75, ed. Hultsch 132. 1-11

In order to inscribe the five polyhedra in a sphere, these things are premised.

Let $AB\Gamma$ be a circle in a sphere, with diameter $A\Gamma$ and centre Δ , and let it be proposed to insert in the

^a Nothing further is known of Erycinus. The propositions next investigated are more elaborate than the one just solved.

^b This is the fourth subject dealt with in *Coll.* iii. For the treatment of the subject by earlier geometers, *v.* vol. i. pp. 216-225, 466-479.

If $AB\Gamma$ be a triangle, and on AB , $B\Gamma$ there be described any parallelograms $AB\Delta E$, $B\Gamma ZH$, and ΔE , ZH be produced to Θ , and ΘB be joined, then the

^a This lemma gives the key to Pappus's method of inscribing the regular solids, which is to find in the case of each solid certain parallel circular sections of the sphere. In the case of the cube, for example, he finds two equal and parallel circular sections, the square on whose diameter is two-thirds of the square on the diameter of the sphere. The squares inscribed in these circles are then opposite faces of the cube. In each case the method of analysis and synthesis is followed. The treatment is quite different from Euclid's.

* Three propositions (Nos. 4, 5 and 6) about the figure known as the *ἀρβηλος* from its resemblance to a leather-worker's knife are contained in Archimedes' *Libri Assumptorum*, which has survived in Arabic. They are included as particular cases in Pappus's exposition, which is unfortunately too long for reproduction here. Professor D'Arcy W. Thompson (*The Classical Review*, lvi. (1942), pp. 75-76) gives reasons for thinking that the *ἀρβηλος* was a saddler's knife rather than a shoemaker's knife, as usually translated.

REVIVAL OF GEOMETRY : PAPPUS

is called the "leather-worker's knife," let there be inscribed any number whatever of circles touching both the semicircles and one another, as those about the centres H, Θ, K, Λ ; to prove that the perpendicular from the centre H to AI is equal to the diameter of the circle about H , the perpendicular from Θ is double of the diameter of the circle about Θ , the perpendicular from K is triple, and the [remaining] perpendiculars in order are so many times the diameters of the proper circles according to the numbers in a series increasing by unity, the inscription of the circles proceeding without limit.^a

(h) SPIRAL ON A SPHERE ^b

Ibid. iv. 35. 53-56, ed. Hultsch 264. 3-268. 21

Just as in a plane a spiral is conceived to be generated by the motion of a point along a straight line revolving in a circle, and in solids [such as the cylinder or cone,]^c by the motion of a point along one straight line describing a certain surface, so also a corresponding spiral can be conceived as described on the sphere after this manner.

Let KAM be a great circle in a sphere with pole Θ , and from Θ let the quadrant of a great circle ΘNK be

^b After leaving the ἀρβηλος, Pappus devotes the remainder of Book iv. to solutions of the problems of doubling the cube, squaring the circle and trisecting an angle. This part has been frequently cited already (v. vol. i. pp. 298-309, 336-363). His treatment of the spiral is noteworthy because his method of proof is often markedly different from that of Archimedes; and in the course of it he makes this interesting digression.

^c Some such addition is necessary, as Commandinus, Chasles and Hultsch realized.

κύκλου τεταρτημόριον γεγράφθω τὸ ΘΝΚ, καὶ ἡ μὲν ΘΝΚ περιφέρεια, περὶ τὸ Θ μένον φερομένη κατὰ τῆς ἐπιφανείας ὡς ἐπὶ τὰ Λ, Μ μέρη,

ἀποκαθιστάσθω πάλιν ἐπὶ τὸ αὐτό, σημεῖον δέ τι φερόμενον ἐπ' αὐτῆς ἀπὸ τοῦ Θ ἐπὶ τὸ Κ παραγινέσθω· γράφει δὴ τινα ἐπὶ τῆς ἐπιφανείας ἑλικά, οἷα ἐστὶν ἡ ΘΟΙΚ, καὶ ἥτις ἂν ἀπὸ τοῦ Θ γραφῇ μεγίστου κύκλου περιφέρεια, πρὸς τὴν ΚΛ περιφέρειαν λόγον ἔχει ὅν ἡ ΛΘ πρὸς τὴν ΘΟ· λέγω δὴ ὅτι, ἂν ἐκτεθῇ τεταρτημόριον τοῦ μεγίστου ἐν τῇ σφαίρᾳ κύκλου τὸ ΑΒΓ περὶ κέντρον τὸ Δ, καὶ ἐπιζευχθῇ ἡ ΓΛ, γίνεται ὡς ἡ τοῦ ἡμισφαιρίου ἐπιφάνεια πρὸς τὴν μεταξὺ τῆς ΘΟΙΚ ἑλίκος καὶ τῆς ΚΝΘ περιφερείας ἀπολαμβανομένην ἐπιφάνειαν, οὕτως ὁ ΑΒΓΔ τομεὺς πρὸς τὸ ΑΒΓ τμήμα.

Ἦχθω γὰρ ἐφαπτομένη τῆς περιφερείας ἡ ΓΖ, καὶ περὶ κέντρον τὸ Γ διὰ τοῦ Α γεγράφθω περιφέρεια ἡ ΑΕΖ· ἴσος ἄρα ὁ ΑΒΓΔ τομεὺς τῷ

* Pappus's method of proof is, in the Archimedean manner, to circumscribe about the surface to be measured a figure consisting of sectors on the sphere, and to circumscribe about the segment ΑΒΓ a figure consisting of sectors of circles; in the same way figures can be inscribed. The divisions need, therefore, to be as numerous as possible. The conclusion can then be reached by the method of exhaustion.

REVIVAL OF GEOMETRY : PAPPUS

sector $A\Delta Z\Gamma$ (for angle $A\Delta\Gamma = 2 \cdot \text{angle } A\Gamma Z$, and $\Delta A^2 = \frac{1}{2} \Delta\Gamma^2$); I say, then, that the ratio of the aforesaid surfaces one towards the other is the same as the ratio of the sector $A\Delta Z\Gamma$ to the segment $AB\Gamma$.

Let ZE be the same [small]^a part of ZA as $K\Lambda$ is of the whole circumference of the circle, and let $E\Gamma$ be joined; then the arc $B\Gamma$ will be the same part of the arc $AB\Gamma$.^b But ΘO is the same part of $\Theta O\Lambda$ as $K\Lambda$ is of the whole circumference [by the property of the spiral]. And arc $\Theta O\Lambda = \text{arc } AB\Gamma$ [ex constructione]. Therefore $\Theta O = B\Gamma$. Let there be described through O about the pole Θ the arc ON , and through B about centre I' the arc BH . Then since the [sector of the] spherical surface $\Lambda K\Theta$ bears to the [sector] $O\Theta N$ the same ratio as the whole surface of the hemisphere bears to the surface of the segment with pole Θ and circular base ON ,^c while the surface of the hemisphere bears to the surface of the segment the same ratio as $\Theta\Lambda^2$ to ΘO^2 ,^d or $E\Gamma^2$ to $B\Gamma^2$, therefore the sector $K\Lambda\Theta$ on the surface [of the sphere] bears to $O\Theta N$ the same ratio as the sector $E\Delta\Gamma$ [in the plane] bears to the sector $BH\Gamma$. Similarly we may show that all the sectors [on the surface of] the hemi-

^b For arc $ZA : \text{arc } ZE = \text{angle } Z\Gamma A : \text{angle } Z\Gamma E$. But angle $Z\Gamma A = \frac{1}{2} \cdot \text{angle } A\Delta\Gamma$, and angle $Z\Gamma E = \frac{1}{2} \cdot \text{angle } B\Delta\Gamma$ [Eucl. iii. 32, 20]. $\therefore \text{arc } ZA : \text{arc } ZE = \text{arc } AB\Gamma : \text{arc } B\Gamma$.

^c Because the arc $K\Lambda$ is the same part of the circumference $K\Lambda M$ as the arc ON is of its circumference.

^d The square on $\Theta\Lambda$ is double the square on the radius of the hemisphere, and therefore half the surface of the hemisphere bears to the surface of a circle of radius $\Theta\Lambda$ [Archim. *De sph. et cyl.* i. 13] : and the surface of the segment is equal to a circle of radius ΘO [ibid. i. 12] : and as circles are to one another as the square on their radii [Eucl. xii. 2], the surface of the hemisphere bears to the surface of the segment the ratio $\Theta\Lambda^2 : \Theta O^2$.

είσιν ἡ ὅλη τοῦ ἡμισφαρίου ἐπιφάνεια, πρὸς τοὺς περιγραφομένους περὶ τὴν ἑλικά τομέας ὁμοταγεῖς τῷ ΘΩΝ, οὕτως πάντες οἱ ἐν τῷ ΑΖΓ τομεῖς οἱ ἴσοι τῷ ΕΖΓ, τουτέστιν ὅλος ὁ ΑΖΓ τομεύς, πρὸς τοὺς περιγραφομένους περὶ τὸ ΑΒΓ τμήμα τοὺς ὁμοταγεῖς τῷ ΓΒΗ. τῷ δ' αὐτῷ τρόπῳ δειχθήσεται καὶ ὡς ἡ τοῦ ἡμισφαρίου ἐπιφάνεια πρὸς τοὺς ἐγγραφομένους τῇ ἑλικί τομέας, οὕτως ὁ ΑΖΓ τομεύς πρὸς τοὺς ἐγγραφομένους τῷ ΑΒΓ τμήματι τομέας, ὥστε καὶ ὡς ἡ τοῦ ἡμισφαρίου ἐπιφάνεια πρὸς τὴν ὑπὸ τῆς ἑλικος ἀπολαμβανομένην ἐπιφάνειαν, οὕτως ὁ ΑΖΓ τομεύς, τουτέστιν τὸ ΑΒΓΔ τεταρτημόριον, πρὸς τὸ ΑΒΓ τμήμα. συνάγεται δὲ διὰ τούτου ἡ μὲν ἀπὸ τῆς ἑλικος ἀπολαμβανομένη ἐπιφάνεια πρὸς τὴν ΘΝΚ περιφέρειαν ὀκταπλασία τοῦ ΑΒΓ τμήματος (ἐπεὶ καὶ ἡ τοῦ ἡμισφαρίου ἐπιφάνεια τοῦ ΑΒΓΔ τομέως), ἡ δὲ μεταξὺ τῆς ἑλικος καὶ τῆς βάσεως τοῦ ἡμισφαρίου ἐπιφάνεια ὀκταπλασία τοῦ ΑΓΔ τριγώνου, τουτέστιν ἴση τῷ ἀπὸ τῆς διαμέτρου τῆς σφαίρας τετραγώνῳ.

^a This would be proved by the method of exhaustion. It is proof of the great part played by this method in Greek geometry that Pappus can take its validity for granted.

^b For the surface of the hemisphere is double of the circle of radius ΑΔ [Archim. *De sph. et cyl.* i. 33] and the sector ΑΒΓΔ is one-quarter of the circle of radius ΑΔ.

^c For the surface between the spiral and the base of the hemisphere is equal to the surface of the hemisphere less the surface cut off from the spiral in the direction ΘΝΚ,

i.e. Surface in question = surface of hemisphere -

8 segment ΑΒΓ',
= 8 sector ΑΒΓΔ - 8 segment ΑΒΓ'

REVIVAL OF GEOMETRY : PAPPUS

sphere equal to $KA\Theta$, together making up the whole surface of the hemisphere, bear to the sectors described about the spiral similar to $O\Theta N$ the same ratio as the sectors in $AZ\Gamma$ equal to $EZ\Gamma$, that is the whole sector $AZ\Gamma$, bear to the sectors described about the segment $AB\Gamma$ similar to ΓBH . In the same manner it may be shown that the surface of the hemisphere bears to the [sum of the] sectors inscribed in the spiral the same ratio as the sector $AZ\Gamma$ bears to the [sum of the] sectors inscribed in the segment $AB\Gamma$, so that the surface of the hemisphere bears to the surface cut off by the spiral the same ratio as the sector $AZ\Gamma$, that is the quadrant $AB\Gamma\Delta$, bears to the segment $AB\Gamma$.^a From this it may be deduced that the surface cut off from the spiral in the direction of the arc ΘNK is eight times the segment $AB\Gamma$ (since the surface of the hemisphere is eight times the sector $AB\Gamma\Delta$),^b while the surface between the spiral and the base of the hemisphere is eight times the triangle $A\Gamma\Delta$, that is, it is equal to the square on the diameter of the sphere.^c

$$= 8 \text{ triangle } A\Gamma\Delta$$

$$= 4A\Delta^2$$

$$= (2A\Delta)^2.$$

and $2A\Delta$ is the diameter of the sphere.

Heath (*H.G.M.* ii. 384-385) gives for this elegant proposition an analytical equivalent, which I have adapted to the Greek lettering. If ρ , ω are the spherical co-ordinates of O with reference to Θ as pole and the arc ΘNK as polar axis, the equation of the spiral is $\omega = 4\rho$. If A is the area of the spiral to be measured, and the radius of the sphere is taken as unity, we have as the element of area

$$dA = d\omega(1 - \cos \rho) = 4d\rho(1 - \cos \rho).$$

^a The whole of Book v. in Pappus's *Collection* is devoted to isoperimetry. The first section follows closely the exposition of Zenodorus as given by Theon (v. *supra*, pp. 386-395),

REVIVAL OF GEOMETRY : PAPPUS

(i) ISOPERIMETRIC FIGURES ^a

Ibid. v., Preface 1-3, ed. Hultsch 304. 5-308. 5

Though God has given to men, most excellent Megethion, the best and most perfect understanding of wisdom and mathematics, He has allotted a partial share to some of the unreasoning creatures as well. To men, as being endowed with reason, He granted that they should do everything in the light of reason and demonstration, but to the other unreasoning creatures He gave only this gift, that each of them should, in accordance with a certain natural forethought, obtain so much as is needful for supporting life. This instinct may be observed to exist in many other species of creatures, but it is specially marked among bees. Their good order and their obedience to the queens who rule in their commonwealths are truly admirable, but much more admirable still is their emulation, their cleanliness in the gathering of honey, and the forethought and domestic care they give to its protection. Believing themselves, no doubt, to be entrusted with the task of bringing from the gods to the more cultured part of mankind a share of

except that Pappus includes the proposition that *of all circular segments having the same circumference the semicircle is the greatest*. The second section compares the volumes of solids whose surfaces are equal, and is followed by a digression, already quoted (*supra*, pp. 194-197) on the semi-regular solids discovered by Archimedes. After some propositions on the lines of Archimedes' *De sph. et cyl.*, Pappus finally proves that *of regular solids having equal surfaces, that is greatest which has most faces*.

The introduction, here cited, on the sagacity of bees is rightly praised by Heath (*H.G.M.* ii. 389) as an example of the good style of the Greek mathematicians when freed from the restraints of technical language.

ambrosia in this form, they do not think it proper to pour it carelessly into earth or wood or any other unseemly and irregular material, but, collecting the fairest parts of the sweetest flowers growing on the earth, from them they prepare for the reception of the honey the vessels called honeycombs, [with cells] all equal, similar and adjacent, and hexagonal in form.

That they have contrived this in accordance with a certain geometrical forethought we may thus infer. They would necessarily think that the figures must all be adjacent one to another and have their sides common, in order that nothing else might fall into the interstices and so defile their work. Now there are only three rectilinear figures which would satisfy the condition, I mean regular figures which are equilateral and equiangular, inasmuch as irregular figures would be displeasing to the bees. For equilateral triangles and squares and hexagons can lie adjacent to one another and have their sides in common without irregular interstices. For the space about the same point can be filled by six equilateral triangles and six angles, of which each is $\frac{2}{3}$ right angle, or by four squares and four right angles, or by three hexagons and three angles of a hexagon, of which each is $1\frac{1}{2}$ right angle. But three pentagons would not suffice to fill the space about the same point, and four would be more than sufficient; for three angles of the pentagon are less than four right angles (inasmuch

(ἐκάστη γὰρ γωνία μιᾶς καὶ ε' ἐστὶν ὀρθῆς), τέσσαρες δὲ γωνίαι μείζους τῶν τεσσάρων ὀρθῶν. ἐπτάγωνα δὲ οὐδὲ τρία περὶ τὸ αὐτὸ σημεῖον δύναται τίθεσθαι κατὰ τὰς πλευρὰς ἀλλήλοις παρακείμενα· τρεῖς γὰρ ἐπταγώνου γωνίαι τεσσάρων ὀρθῶν μείζονες (ἐκάστη γάρ ἐστὶν μιᾶς ὀρθῆς καὶ τριῶν ἐβδόμων). ἔτι δὲ μᾶλλον ἐπὶ τῶν πολυγωνοτέρων ὁ αὐτὸς ἐφαρμόσαι δυνήσεται λόγος. ὄντων δὴ οὖν τριῶν σχημάτων τῶν ἐξ αὐτῶν δυναμένων συμπληρῶσαι τὸν περὶ τὸ αὐτὸ σημεῖον τόπον, τριγώνου τε καὶ τετραγώνου καὶ ἑξαγώνου, τὸ πολυγωνότερον εἴλαντο διὰ τὴν σοφίαν αἱ μέλισσαι πρὸς τὴν παρασκευὴν, ἅτε καὶ πλείον ἑκατέρου τῶν λοιπῶν αὐτὸ χωρεῖν ὑπολαμβάνουσαι μέλι.

Καὶ αἱ μέλισσαι μὲν τὸ χρήσιμον αὐταῖς ἐπίστανται μόνον τοῦθ' ὅτι τὸ ἑξάγωνον τοῦ τετραγώνου καὶ τοῦ τριγώνου μείζον ἐστὶν καὶ χωρῆσαι δύναται πλείον μέλι τῆς ἴσης εἰς τὴν ἐκάστου κατασκευὴν ἀναλίσκομένης ὕλης, ἡμεῖς δὲ πλέον τῶν μελισσῶν σοφίας μέρος ἔχειν ὑπισχνούμενοι ζητήσομέν τι καὶ περισσότερον. τῶν γὰρ ἴσην ἔχόντων περίμετρον ἰσοπλεύρων τε καὶ ἰσογωνίων ἐπιπέδων σχημάτων μείζον ἐστὶν αἰετὶ τὸ πολυγωνότερον, μέγιστος δ' ἐν πᾶσιν ὁ κύκλος, ὅταν ἴσην αὐτοῖς περίμετρον ἔχη.

(j) APPARENT FORM OF A CIRCLE

Ibid. vi. 48. 90-91, ed. Hultsch 580. 12-27

"Ἐστω κύκλος ὁ ΑΒΓ, οὗ κέντρον τὸ Ε, καὶ ἀπὸ τοῦ Ε πρὸς ὀρθὰς ἔστω τῷ τοῦ κύκλου ἐπι-

REVIVAL OF GEOMETRY: PAPPUS

as each angle is $1\frac{1}{2}$. right angle), and four angles are greater than four right angles. Nor can three heptagons be placed about the same point so as to have their sides adjacent to each other ; for three angles of a heptagon are greater than four right angles (inasmuch as each is $1\frac{3}{4}$. right angle). And the same argument can be applied even more to polygons with a greater number of angles. There being, then, three figures capable by themselves of filling up the space around the same point, the triangle, the square and the hexagon, the bees in their wisdom chose for their work that which has the most angles, perceiving that it would hold more honey than either of the two others.

Bees, then, know just this fact which is useful to them, that the hexagon is greater than the square and the triangle and will hold more honey for the same expenditure of material in constructing each. But we, claiming a greater share in wisdom than the bees, will investigate a somewhat wider problem, namely that, *of all equilateral and equiangular plane figures having an equal perimeter, that which has the greater number of angles is always greater, and the greatest of them all is the circle having its perimeter equal to them.*

(j) APPARENT FORM OF A CIRCLE

Ibid. vi.^a 48. 90-91, ed. Hultsch 580. 12-27

Let $AB\Gamma$ be a circle with centre E , and from E let EZ be drawn perpendicular to the plane of the circle ;

^a Most of Book vi. is astronomical, covering the treatises in the *Little Astronomy* (v. *supra*, p. 408 n. b). The proposition here cited comes from a section on Euclid's *Optics*.

πέδῳ ἢ EZ· λέγω, ὅτι ἐὰν ἐπὶ τῆς EZ τὸ ὄμμα
τεθῇ ἴσαι αἱ διαμέτροι φαίνονται τοῦ κύκλου.

Τοῦτο δὲ δῆλον· ἅπασαι γὰρ αἱ ἀπὸ τοῦ Z πρὸς
τὴν τοῦ κύκλου περιφέρειαν προσπίπτουσαι εὐθεῖαι
ἴσαι εἰσὶν ἀλλήλαις καὶ ἴσας γωνίας περιέχουσιν.

Μὴ ἔστω δὲ ἡ EZ πρὸς ὀρθὰς τῷ τοῦ κύκλου
ἐπιπέδῳ, ἴση δὲ ἔστω τῇ ἐκ τοῦ κέντρου τοῦ
κύκλου· λέγω, ὅτι τοῦ ὀμματος ὄντος πρὸς τῷ Z
σημείῳ καὶ οὕτως αἱ διαμέτροι ἴσαι ὀρῶνται.

REVIVAL OF GEOMETRY : PAPPUS

I say that, if the eye be placed on EZ , the diameters of the circle appear equal.*

This is obvious ; for all the straight lines falling from Z on the circumference of the circle are equal one to another and contain equal angles.

Now let EZ be not perpendicular to the plane of the circle, but equal to the radius of the circle ; I say that, if the eye be at the point Z , in this case also the diameters appear equal.

For let two diameters $A\Gamma$, $B\Delta$ be drawn, and let ZA , ZB , $Z\Gamma$, $Z\Delta$ be joined. Since the three straight

* As they will do if they subtend an equal angle at the eye.

τρεις αἱ ΕΑ, ΕΓ, ΕΖ ἴσαι εἰσίν, ὀρθὴ ἄρα ἡ ὑπὸ ΑΖΓ γωνία. διὰ τὰ αὐτὰ δὴ καὶ ἡ ὑπὸ ΒΖΔ ὀρθὴ ἐστίν· ἴσαι ἄρα φανήσονται αἱ ΑΓ, ΒΔ διάμετροι. ὁμοίως δὴ δείξομεν ὅτι καὶ πᾶσαι.

(k) THE "TREASURY OF ANALYSIS"

Ibid. vii., Praef. 1-3, ed. Hultsch 634. 3-636. 30

Ὁ καλούμενος ἀναλυόμενος, Ἐρμόδωρε τέκνον, κατὰ σύλληψιν ἰδία τίς ἐστίν ὕλη παρεσκευασμένη μετὰ τὴν τῶν κοινῶν στοιχείων ποίησιν τοῖς βουλομένοις ἀναλαμβάνειν ἐν γραμμαῖς δύναμιν εὐρετικὴν τῶν προτεινομένων αὐτοῖς προβλημάτων, καὶ εἰς τοῦτο μόνον χρησίμη καθεστῶσα. γέγραπται δὲ ὑπὸ τριῶν ἀνδρῶν, Εὐκλείδου τε τοῦ Στοιχειωτοῦ καὶ Ἀπολλωνίου τοῦ Περγαίου καὶ Ἀρισταίου τοῦ πρεσβυτέρου, κατὰ ἀνάλυσιν καὶ σύνθεσιν ἔχουσα τὴν ἔφοδον.

Ἀνάλυσις τοίνυν ἐστίν ὁδὸς ἀπὸ τοῦ ζητουμένου ὡς ὁμολογουμένου διὰ τῶν ἐξῆς ἀκολουθῶν ἐπὶ τι ὁμολογούμενον συνθέσει· ἐν μὲν γὰρ τῇ ἀναλύσει τὸ ζητούμενον ὡς γεγονὸς ὑποθέμενοι τὸ ἐξ οὗ τοῦτο συμβαίνει σκοπούμεθα καὶ πάλιν ἐκείνου τὸ προηγούμενον, ἕως ἂν οὕτως ἀναποδίζοντες καταστήσωμεν εἰς τι τῶν ἤδη γνωριζομένων ἢ τάξιν ἀρχῆς ἐχόντων· καὶ τὴν τοιαύτην ἔφοδον ἀνάλυσιν καλοῦμεν, οἷον ἀνάπαλιν λύσιν.

Ἐν δὲ τῇ συνθέσει ἐξ ὑποστροφῆς τὸ ἐν τῇ ἀναλύσει καταληφθὲν ὕστατον ὑποστησάμενοι γεγονὸς ἤδη, καὶ ἐπόμενα τὰ ἐκεῖ [ἐνταῦθα]¹ προ-

¹ ἐνταῦθα om. Hultsch.

REVIVAL OF GEOMETRY : PAPPUS

lines EA, EI, EZ are equal, therefore the angle AZI is right. And by the same reasoning the angle BZA is right; therefore the diameters AI, BE appear equal. Similarly we may show that all are equal.

(k) THE "TREASURY OF ANALYSIS"

Ibid. vii., Preface 1-3, ed. Hultsch 634. 3-636. 30

The so-called *Treasury of Analysis*, my dear Hermodorus, is, in short, a special body of doctrine furnished for the use of those who, after going through the usual elements, wish to obtain power to solve problems set to them involving curves,^a and for this purpose only is it useful. It is the work of three men, Euclid the writer of the *Elements*, Apollonius of Perga and Aristaeus the elder, and proceeds by the method of analysis and synthesis.

Now *analysis* is a method of taking that which is sought as though it were admitted and passing from it through its consequences in order to something which is admitted as a result of synthesis; for in analysis we suppose that which is sought to be already done, and we inquire what it is from which this comes about, and again what is the antecedent cause of the latter, and so on until, by retracing our steps, we light upon something already known or ranking as a first principle; and such a method we call analysis, as being a reverse solution.

But in *synthesis*, proceeding in the opposite way, we suppose to be already done that which was last reached in the analysis, and arranging in their natural

^a Or, perhaps, "to give a complete theoretical solution of problems set to them"; *v. supra*, p. 414 n. a.

ηγούμενα κατὰ φύσιν τάξαντες καὶ ἀλλήλοις ἐπισυνθέντες, εἰς τέλος ἀφικνούμεθα τῆς τοῦ ζητουμένου κατασκευῆς· καὶ τοῦτο καλοῦμεν σύνθεσιν.

Διττὸν δ' ἐστὶν ἀναλύσεως γένος τὸ μὲν ζητητικὸν τὰληθοῦς, ὃ καλεῖται θεωρητικόν, τὸ δὲ ποριστικὸν τοῦ προταθέντος [λέγειν],¹ ὃ καλεῖται προβληματικόν. ἐπὶ μὲν οὖν τοῦ θεωρητικοῦ γένους τὸ ζητούμενον ὡς ὃν ὑποθέμενοί καὶ ὡς ἀληθές, εἴτα διὰ τῶν ἐξῆς ἀκολουθῶν ὡς ἀληθῶν καὶ ὡς ἔστιν· καθ' ὑπόθεσιν προελθόντες ἐπὶ τι ὁμολογούμενον, εἰ μὲν ἀληθές ἢ ἐκεῖνο τὸ ὁμολογούμενον, ἀληθές ἔσται καὶ τὸ ζητούμενον, καὶ ἡ ἀπόδειξις ἀντίστροφος τῇ ἀναλύσει, εἰ μὲν δὲ ψεύδει ὁμολογουμένῳ ἐντύχομεν, ψεῦδος ἔσται καὶ τὸ ζητούμενον. ἐπὶ δὲ τοῦ προβληματικοῦ γένους τὸ προταθὲν ὡς γνωσθὲν ὑποθέμενοι, εἴτα διὰ τῶν ἐξῆς ἀκολουθῶν ὡς ἀληθῶν προελθόντες ἐπὶ τι ὁμολογούμενον, εἰ μὲν τὸ ὁμολογούμενον δυνατόν ἢ καὶ ποριστόν, ὃ καλοῦσιν οἱ ἀπὸ τῶν μαθημάτων δοθέν, δυνατόν ἔσται καὶ τὸ προταθὲν, καὶ πάλιν ἡ ἀπόδειξις ἀντίστροφος τῇ ἀναλύσει, εἰ μὲν δὲ ἀδυνάτῳ ὁμολογουμένῳ ἐντύχομεν, ἀδύνατον ἔσται καὶ τὸ πρόβλημα.

Τοσαῦτα μὲν οὖν περὶ ἀναλύσεως καὶ συνθέσεως.

Τῶν δὲ προειρημένων τοῦ ἀναλυομένου βιβλίων ἡ τάξις ἐστὶν τοιαύτη. Εὐκλείδου Δεδομένων βιβλίον α, Ἀπολλωνίου Λόγου ἀποτομῆς β, Χωρίου ἀποτομῆς β, Διωρισμένης τομῆς δύο, Ἐπαφῶν δύο, Εὐκλείδου Πορισμάτων τρία, Ἀπολλωνίου Νέυσεων δύο, τοῦ αὐτοῦ Τόπων ἐπιπέδων δύο,

¹ λέγειν om. Hultsch.

REVIVAL OF GEOMETRY : PAPPUS

order as consequents what were formerly antecedents and linking them one with another, we finally arrive at the construction of what was sought ; and this we call synthesis.

Now analysis is of two kinds, one, whose object is to seek the truth, being called *theoretical*, and the other, whose object is to find something set for finding, being called *problematical*. In the theoretical kind we suppose the subject of the inquiry to exist and to be true, and then we pass through its consequences in order, as though they also were true and established by our hypothesis, to something which is admitted ; then, if that which is admitted be true, that which is sought will also be true, and the proof will be the reverse of the analysis, but if we come upon something admitted to be false, that which is sought will also be false. In the problematical kind we suppose that which is set as already known, and then we pass through its consequences in order, as though they were true, up to something admitted ; then, if what is admitted be possible and can be done, that is, if it be what the mathematicians call *given*, what was originally set will also be possible, and the proof will again be the reverse of the analysis, but if we come upon something admitted to be impossible, the problem will also be impossible.

So much for analysis and synthesis.

This is the order of the books in the aforesaid *Treasury of Analysis*. Euclid's *Data*, one book, Apollonius's *Cutting-off of a Ratio*, two books, *Cutting-off of an Area*, two books, *Determinate Section*, two books, *Contacts*, two books, Euclid's *Porisms*, three books, Apollonius's *Fergings*, two books, his *Plane Loci*, two books, *Conics*, eight books, Aristaeus's

Κωνικῶν ἤ, Ἀρισταίου Τόπων στερεῶν πέντε, Εὐκλείδου Τόπων τῶν πρὸς ἐπιφανείᾳ δύο, Ἐρατοσθένους Περὶ μεσοτήτων δύο. γίνεται βιβλία λγ, ὧν τὰς περιοχὰς μέχρι τῶν Ἀπολλωνίου Κωνικῶν ἐξεθέμην σοι πρὸς ἐπίσκεψιν, καὶ τὸ πλῆθος τῶν τόπων καὶ τῶν διορισμῶν καὶ τῶν πτώσεων καθ' ἕκαστον βιβλίον, ἀλλὰ καὶ τὰ λήμματα τὰ ζητούμενα, καὶ οὐδεμίαν ἐν τῇ πραγματείᾳ τῶν βιβλίων καταλέλοιπα ζήτησιν, ὥς ἐνόμιζον.

(l) LOCUS WITH RESPECT TO FIVE OR SIX LINES

Ibid. vii. 38-40, ed. Hultsch 680. 2-30

Ἐὰν ἀπὸ τινος σημείου ἐπὶ θέσει δεδομένας εὐθείας πέντε καταχθῶσιν εὐθεῖαι ἐν δεδομέναις γωνίαις, καὶ λόγος ἥ δεδομένος τοῦ ὑπὸ τριῶν κατηγμένων περιεχομένου στερεοῦ παραλληλεπιπέδου ὀρθογωνίου πρὸς τὸ ὑπὸ τῶν λοιπῶν δύο κατηγμένων καὶ δοθείσης τινὸς περιεχόμενον παραλληλεπίπεδον ὀρθογώνιον, ἄψεται τὸ σημεῖον θέσει δεδομένης γραμμῆς. ἔάν τε ἐπὶ $\bar{\epsilon}$, καὶ λόγος ἥ δοθεὶς τοῦ ὑπὸ τῶν τριῶν περιεχομένου προειρημένου στερεοῦ πρὸς τὸ ὑπὸ τῶν λοιπῶν τριῶν, πάλιν τὸ σημεῖον ἄψεται θέσει δεδομένης. ἔὰν δὲ ἐπὶ πλείονας τῶν $\bar{\epsilon}$, οὐκέτι μὲν ἔχουσι λέγειν, “ἔὰν λόγος ἥ δοθεὶς τοῦ ὑπὸ τῶν δ περιεχομένου τινὸς πρὸς τὸ ὑπὸ τῶν λοιπῶν,” ἐπεὶ οὐκ ἔστι τι

* These propositions follow a passage on the locus with respect to three or four lines which has already been quoted (v. vol. i. pp. 486-489). The passages come from Pappus's

REVIVAL OF GEOMETRY: PAPPUS

Solid Loci, five books, Euclid's *Surface Loci*, two books, Eratosthenes' *On Means*, two books. In all there are thirty-three books, whose contents as far as Apollonius's *Conics* I have set out for your examination, including not only the number of the propositions, the conditions of possibility and the cases dealt with in each book, but also the lemmas which are required; indeed, I believe that I have not omitted any inquiry arising in the study of these books.

(L) LOCUS WITH RESPECT TO FIVE OR SIX LINES ^a

Ibid. vii. 38-40, 2d. Hultsch 680. 2-30

If from any point straight lines be drawn to meet at given angles five straight lines given in position, and the ratio be given between the volume of the rectangular parallelepiped contained by three of them to the volume of the rectangular parallelepiped contained by the remaining two and a given straight line, the point will lie on a curve given in position. If there be six straight lines, and the ratio be given between the volume of the aforesaid solid formed by three of them to the volume of the solid formed by the remaining three, the point will again lie on a curve given in position. If there be more than six straight lines, it is no longer permissible to say "if the ratio be given between some figure contained by four of them to some figure contained by the remainder," since no figure can be contained in more

account of the *Conics* of Apollonius, who had worked out the locus with respect to three or four lines. It was by reflection on this passage that Descartes evolved the system of co-ordinates described in his *Géométrie*.

περιεχόμενον ὑπὸ πλειόνων ἢ τριῶν διαστάσεων.

REVIVAL OF GEOMETRY : PAPPUS

than three dimensions. It is true that some recent writers have agreed among themselves to use such expressions,^a but they have no clear meaning when they multiply the rectangle contained by these straight lines with the square on that or the rectangle contained by those. They might, however, have expressed such matters by means of the composition of ratios, and have given a general proof both for the aforesaid propositions and for further propositions after this manner : *If from any point straight lines be drawn to meet at given angles straight lines given in position, and there be given the ratio compounded of that which one straight line so drawn bears to another, that which a second bears to a second, that which a third bears to a third, and that which the fourth bears to a given straight line—if there be seven, or, if there be eight, that which the fourth bears to the fourth—the point will lie on a curve given in position ; and similarly, however many the straight lines be, and whether odd or even. Though, as I said, these propositions follow the locus on four lines, [geometers] have by no means solved them to the extent that the curve can be recognized.*^b

^a As Heron in his formula for the area of a triangle, given the sides (*supra*, pp. 476-477).

^b The general proposition can thus be stated : If $p_1, p_2, p_3, \dots, p_n$ be the lengths of straight lines drawn to meet n given straight lines at given angles (where n is odd), and a be a given straight line, then if

$$\frac{p_1}{p_2} \cdot \frac{p_3}{p_4} \cdot \dots \cdot \frac{p_n}{a} = \lambda,$$

where λ is a constant, the point will lie on a curve given in position. This will also be true if n is even and

$$\frac{p_1}{p_2} \cdot \frac{p_3}{p_4} \cdot \dots \cdot \frac{p_{n-1}}{p_n} = \lambda.$$

(III) ANTICIPATION OF GULDIN'S THEOREM

Ibid. vii. 41-42, ed. Hultsch 680. 30-682. 20

“ Ταῦθ’ οἱ βλέποντες ἤκιστα ἐπαίρονται, καθάπερ οἱ πάλαι καὶ τῶν τὰ κρείττονα γραψάντων ἕκαστοι· ἐγὼ δὲ καὶ πρὸς ἀρχαῖς ἔτι τῶν μαθημάτων καὶ τῆς ὑπὸ φύσεως προκειμένης ζητημάτων ὕλης κινουμένους ὁρῶν ἅπαντας, αἰδούμενος ἐγὼ καὶ δείξας γε πολλῶ κρείσσονα καὶ πολλὴν προφερόμενα ὠφέλειαν . . . ἵνα δὲ μὴ κεναῖς χερσὶ τοῦτο φθεγξάμενος ὧδε χωρισθῶ τοῦ λόγου, ταῦτα δώσω ταῖς ἀναγνοῦσιν· ὁ μὲν τῶν τελείων ἀμφοιστικῶν λόγος συνήπται ἔκ τε τῶν ἀμφοισμάτων καὶ τῶν ἐπὶ τοὺς ἄξονας ὁμοίως κατηγμένων εὐθειῶν ἀπὸ τῶν ἐν αὐτοῖς κεντροβαρικῶν σημείων, ὁ δὲ τῶν ἀτελῶν ἔκ τε τῶν ἀμφοισμάτων καὶ τῶν περιφερειῶν, ὅσας ἐποίησεν τὰ ἐν τούτοις κεντροβαρικὰ σημεία, ὁ δὲ τούτων τῶν περιφερειῶν λόγος συνήπται δῆλον ὡς ἔκ τε τῶν κατηγμένων καὶ ὧν περιέχουσιν αἱ τούτων ἄκραι, εἰ καὶ εἴεν πρὸς τοῖς ἄξοσιν ἀμφοιστικῶν, γωνιῶν. περι-

^a Paul Guldin (1577-1643), or Guldinus, is generally credited with the discovery of the celebrated theorem here enunciated by Pappus. It may be stated: *If any plane figure revolve about an external axis in its plane, the volume of the solid figure so generated is equal to the product of the area of the figure and the distance through which the centre of gravity of the figure moves.* There is a corresponding theorem for the area.

^b The whole passage is ascribed to an interpolator by Hultsch, but without justice; and, as Heath observes (*H.G.M.* ii. 408), it is difficult to think of any Greek mathematician after Pappus's time who could have discovered such an advanced proposition.

Though the meaning is clear enough, an exact translation

REVIVAL OF GEOMETRY: PAPPUS

(m) ANTICIPATION OF GULDIN'S THEOREM ^a

Ibid. vii. 41-42, ed. Hultsch 680. 30-682. 20 ^b

The men who study these matters are not of the same quality as the ancients and the best writers. Seeing that all geometers are occupied with the first principles of mathematics and the natural origin of the subject matter of investigation, and being ashamed to pursue such topics myself, I have proved propositions of much greater importance and utility . . . and in order not to make such a statement with empty hands, before leaving the argument I will give these enunciations to my readers. *Figures generated by a complete revolution of a plane figure about an axis are in a ratio compounded (a) of the ratio [of the areas] of the figures, and (b) of the ratio of the straight lines similarly drawn to^c the axes of rotation from the respective centres of gravity. Figures generated by incomplete revolutions are in a ratio compounded (a) of the ratio [of the areas] of the figures, and (b) of the ratio of the arcs described by the centres of gravity of the respective figures, the ratio of the arcs being itself compounded (1) of the ratio of the straight lines similarly drawn [from the respective centres of gravity to the axes of rotation] and (2) of the ratio of the angles contained about the axes of revolution by the extremities of these straight lines.*^d These propositions, which are practi-

is impossible; I have drawn on the translations made by Halley (v. Papp. Coll., ed. Hultsch 683 n. 2) and Heath (*H.G.M.* ii. 402-403). The obscurity of the language is presumably the only reason why Hultsch brackets the passage, as he says: "exciderunt autem in eodem loco pauciora plurave genuina Pappi verba."

^c i.e., drawn to meet at the same angles.

^d The extremities are the centres of gravity.

cally one, include a large number of theorems of all sorts about curves, surfaces and solids, all of which are proved simultaneously by one demonstration, and include propositions never before proved as well as those already proved, such as those in the twelfth book of these elements.^a

(n) LEMMAS TO THE TREATISES ^b

(i.) *To the "Determinate Section" of Apollonius*

Ibid. vii. 115, ed. Hultsch, Prop. 61, 756. 28-760. 4

Given three straight lines AB, BΓ, ΓΔ,^c if AB . BΔ :

AΓ . ΓΔ = BE² : EΓ², then the ratio AE . EΔ : BE . EΓ

^a If the passage be genuine, which there seems little reason to doubt, this is evidence that Pappus's work ran to twelve books at least.

^b The greater part of Book vii. is devoted to lemmas required for the books in the *Treasury of Analysis* as far as Apollonius's *Conics*, with the exception of Euclid's *Data* and with the addition of two isolated lemmas to Euclid's *Surface-Loci*. The lemmas are numerous and often highly interesting from the mathematical point of view. The two here cited are given only as samples of this important collection: the first lemma to the *Surface-Loci*, one of the two passages in Greek referring to the focus-directrix property of a conic, has already been given (vol. i. pp. 492-503).

^c It is left to be understood that they are in one straight line AΔ.

ΒΕΓ· λέγω δὴ ὅτι ὁ αὐτός ἐστιν τῷ τοῦ ἀπὸ τῆς ΑΔ πρὸς τὸ ἀπὸ τῆς ὑπεροχῆς ἢ ὑπερέχει ἢ δυναμένη τὸ ὑπὸ ΑΓ, ΒΔ τῆς δυναμένης τὸ ὑπὸ ΑΒ, ΓΔ.

Γεγράφθω περὶ τὴν ΑΔ κύκλος, καὶ ἤχθωσαν ὀρθαὶ αἱ ΒΖ, ΓΗ. ἐπεὶ οὖν ἐστὶν ὡς τὸ ὑπὸ ΑΒΔ πρὸς τὸ ὑπὸ ΑΓΔ, τουτέστιν ὡς τὸ ἀπὸ ΒΖ πρὸς τὸ ἀπὸ ΓΗ, οὕτως τὸ ἀπὸ ΒΕ πρὸς τὸ ἀπὸ ΕΓ, καὶ μήκει ἄρα ἐστὶν ὡς ἡ ΒΖ πρὸς τὴν ΓΗ, οὕτως ἡ ΒΕ πρὸς τὴν ΕΓ· εὐθεῖα ἄρα ἐστὶν ἡ διὰ τῶν Ζ, Ε, Η. ἔστω ἡ ΖΕΗ, καὶ ἐκβεβλήσθω ἡ μὲν ΗΓ ἐπὶ τὸ Θ, ἐπιζευχθεῖσα δὲ ἡ ΖΘ ἐκβεβλήσθω ἐπὶ τὸ Κ, καὶ ἐπ' αὐτὴν κάθετος ἤχθω ἡ ΔΚ. καὶ διὰ δὴ τὸ προγεγραμμένον λήμμα γίνεται τὸ μὲν ὑπὸ ΑΓ, ΒΔ ἴσον τῷ ἀπὸ ΖΚ, τὸ δὲ ὑπὸ ΑΒ, ΓΔ τῷ ἀπὸ ΘΚ· λοιπὴ ἄρα ἡ ΖΘ ἐστὶν ἡ ὑπεροχὴ ἢ ὑπερέχει ἢ δυναμένη τὸ ὑπὸ ΑΓ, ΒΔ τῆς δυναμένης τὸ ὑπὸ ΑΒ, ΓΔ. ἤχθω οὖν διὰ τοῦ κέντρου ἡ ΖΛ, καὶ ἐπεξεύχθω ἡ ΘΛ. ἐπεὶ οὖν ὀρθὴ ἡ ὑπὸ ΖΘΛ ὀρθῇ τῇ ὑπὸ ΕΓΗ ἐστὶν ἴση, ἐστὶν δὲ καὶ ἡ πρὸς τῷ Λ τῇ πρὸς τῷ Η γωνία ἴση, ἰσογώνια ἄρα τὰ τρίγωνα· ἐστὶν ἄρα ὡς ἡ ΑΖ πρὸς τὴν ΘΖ, τουτέστιν ὡς ἡ ΑΔ πρὸς τὴν ΖΘ, οὕτως ἡ ΕΗ πρὸς τὴν ΕΓ· καὶ ὡς ἄρα τὸ ἀπὸ ΑΔ πρὸς τὸ ἀπὸ ΖΘ, οὕτως τὸ ἀπὸ ΕΗ πρὸς τὸ ἀπὸ ΕΓ, καὶ τὸ ὑπὸ ΗΕ, ΕΖ, τουτέστιν τὸ ὑπὸ ΑΕ, ΕΔ, πρὸς τὸ ὑπὸ ΒΕ, ΕΓ. καὶ ἐστὶν ὁ μὲν τοῦ ὑπὸ ΑΕ, ΕΔ πρὸς τὸ ὑπὸ ΒΕ,

* For, because $BZ : GH = BE : EI$, the triangles ZEB, HIE are similar, and angle $ZEB = \text{angle } HIE$; $\therefore E$ is in the same straight line with B, I [Eucl. i. 13, Conv.].

REVIVAL OF GEOMETRY: PAPPUS

is singular and a minimum; and I say that this ratio is equal to $A\Delta^2 : (\sqrt{A\Gamma \cdot B\Delta} - \sqrt{AB \cdot \Gamma\Delta})^2$.

Let a circle be described about $A\Delta$, and let BZ , ΓH be drawn perpendicular [to $A\Delta$]. Then since

$$AB \cdot B\Delta : A\Gamma \cdot \Gamma\Delta = BE^2 : E\Gamma^2, \quad [\text{ex hyp.}]$$

i.e.,

$$BZ^2 : \Gamma H^2 = BE^2 : E\Gamma^2,$$

[Eucl. x. 33, Lemma

\therefore

$$BZ : \Gamma H = BE : E\Gamma.$$

Therefore Z , E , H lie on a straight line.^a Let it be ZEH , and let $H\Gamma$ be produced to Θ , and let ZO be joined and produced to K , and let ΔK be drawn perpendicular to it. Then by the lemma just proved [Lemma 19]

$$A\Gamma \cdot B\Delta = ZK^2,$$

$$AB \cdot \Gamma\Delta = \Theta K^2;$$

[on taking the roots and] subtracting,

$$[ZK - \Theta K =] Z\Theta = \sqrt{A\Gamma \cdot B\Delta} - \sqrt{AB \cdot \Gamma\Delta}.$$

Let $Z\Lambda$ be drawn through the centre, and let $\Theta\Lambda$ be joined. Then since the right angle $Z\Theta\Lambda$ = the right angle $E\Gamma H$, and the angle at Λ = the angle at H , therefore the triangles $[Z\Theta\Lambda, E\Gamma H]$ are equiangular;

\therefore

$$\Lambda Z : \Theta Z = EH : E\Gamma,$$

i.e.,

$$A\Delta : Z\Theta = EH : E\Gamma;$$

\therefore

$$A\Delta^2 : Z\Theta^2 = EH^2 : E\Gamma^2$$

$$= HE \cdot EZ : BE \cdot E\Gamma^b$$

$$= AE \cdot EA : BE \cdot E\Gamma.$$

[Eucl. iii. 35

And [therefore] the ratio $AE \cdot EA : BE \cdot E\Gamma$ is

^b Because, on account of the similarity of the triangles HTE , ZBE , we have $HE : ET = EZ : EB$.

ΕΓ μοναχὸς καὶ ἐλάσσων λόγος, ἢ δὲ ΖΘ ἢ ὑπεροχὴ ἢ ὑπερέχει ἢ δυναμένη τὸ ὑπὸ τῶν ΑΓ, ΒΔ τῆς δυναμένης τὸ ὑπὸ ΑΒ, ΓΔ [τουτέστιν τὸ ἀπὸ τῆς ΖΚ τοῦ ἀπὸ τῆς ΘΚ],¹ ὥστε ὁ μοναχὸς καὶ ἐλάσσων λόγος ὁ αὐτὸς ἐστὶν τῷ ἀπὸ τῆς ΑΔ πρὸς τὸ ἀπὸ τῆς ὑπεροχῆς ἢ ὑπερέχει ἢ δυναμένη τὸ ὑπὸ ΑΓ, ΒΔ τῆς δυναμένης τὸ ὑπὸ ΑΒ, ΓΔ, ὅπερ :~

singular and a minimum, while [, as proved above,]

$ZO = \sqrt{AI \cdot \Gamma\Delta} - \sqrt{AB \cdot \Gamma\Delta}$, so that the same singular and minimum ratio =

$$A\Delta^2 : (\sqrt{AI \cdot \Gamma\Delta} - \sqrt{AB \cdot \Gamma\Delta})^2. \quad \text{Q.E.D.}^a$$

(ii.) To the " *Porisms* " of Euclid ^b

Ibid. vii. 198, ed. Hultsch, Prop. 130, 872. 23-874. 27

Let $AB\Gamma\Delta EZH\Theta K\Lambda$ be a figure,^c and let $AZ \cdot B\Gamma : AB \cdot \Gamma Z = AZ \cdot \Delta E : A\Delta \cdot EZ$; [I say] that the line through the points Θ, H, Z is a straight line.

^a Notice the sign \sim used in the Greek for $\epsilon\delta\epsilon\iota\chi\alpha\iota$. In all Pappus proves this property for three different positions of the points, and it supports the view (*v. supra*, p. 341 n. a) that Apollonius's work formed a complete treatise on involution.

^b *v.* vol. i. pp. 478-485.

^c Following Breton de Champ and Hultsch I reproduce the second of the eight figures in the mss., which vary according to the disposition of the points.

¹ $\tau\omicron\upsilon\tau\epsilon\omicron\tau\iota\nu \dots \tau\eta\varsigma \Theta K$ om. Hultsch.

Ἐπεὶ ἐστὶν ὡς τὸ ὑπὸ ΑΖ, ΒΓ πρὸς τὸ ὑπὸ ΑΒ, ΓΖ, οὕτως τὸ ὑπὸ ΑΖ, ΔΕ πρὸς τὸ ὑπὸ ΑΔ, ΕΖ ἐναλλάξ ἐστὶν ὡς τὸ ὑπὸ ΑΖ, ΒΓ πρὸς τὸ ὑπὸ ΑΖ, ΔΕ, τουτέστιν ὡς ἡ ΒΓ πρὸς τὴν ΔΕ, οὕτως τὸ ὑπὸ ΑΒ, ΓΖ πρὸς τὸ ὑπὸ ΑΔ, ΕΖ. ἀλλ' ὁ μὲν τῆς ΒΓ πρὸς τὴν ΔΕ συνήπται λόγος, εἰὰν διὰ τοῦ Κ τῇ ΑΖ παράλληλος ἀχθῇ ἡ ΚΜ, ἔκ τε τοῦ τῆς ΒΓ πρὸς ΚΝ καὶ τῆς ΚΝ πρὸς ΚΜ καὶ ἔτι τοῦ τῆς ΚΜ πρὸς ΔΕ, ὁ δὲ τοῦ ὑπὸ ΑΒ, ΓΖ πρὸς τὸ ὑπὸ ΑΔ, ΕΖ συνήπται ἔκ τε τοῦ τῆς ΒΑ πρὸς ΑΔ καὶ τοῦ τῆς ΓΖ πρὸς τὴν ΖΕ. κοινὸς ἐκκεκρούσθω ὁ τῆς ΒΑ πρὸς ΑΔ ὁ αὐτὸς ὢν τῷ τῆς ΝΚ πρὸς ΚΜ. λοιπὸν ἄρα ὁ τῆς ΓΖ πρὸς τὴν ΖΕ συνήπται ἔκ τε τοῦ τῆς ΒΓ πρὸς τὴν ΚΝ, τουτέστιν τοῦ τῆς ΘΓ πρὸς τὴν ΚΘ, καὶ τοῦ τῆς ΚΜ πρὸς τὴν ΔΕ, τουτέστιν τοῦ τῆς ΚΗ πρὸς τὴν ΗΕ. εὐθεία ἄρα ἡ διὰ τῶν Θ, Η, Ζ.

Ἐὰν γὰρ διὰ τοῦ Ε τῇ ΘΓ παράλληλον ἀγάγω τὴν ΕΞ, καὶ ἐπιζευχθεῖσα ἡ ΘΗ ἐκβληθῇ ἐπὶ τὸ Ε, ὁ μὲν τῆς ΚΗ πρὸς τὴν ΗΕ λόγος ὁ αὐτὸς ἐστὶν τῷ τῆς ΚΘ πρὸς τὴν ΕΞ, ὁ δὲ συνημμένος ἔκ τε τοῦ τῆς ΓΘ πρὸς τὴν ΘΚ καὶ τοῦ τῆς ΘΚ πρὸς τὴν ΕΞ μεταβάλλεται εἰς τὸν τῆς ΘΓ πρὸς ΕΞ λόγον, καὶ ὁ τῆς ΓΖ πρὸς ΖΕ λόγος ὁ αὐτὸς τῷ τῆς ΓΘ πρὸς τὴν ΕΞ. παραλλήλου οὕσης τῆς ΓΘ τῇ ΕΞ, εὐθεία ἄρα ἐστὶν ἡ διὰ τῶν Θ, Ε, Ζ (τοῦτο γὰρ φανερόν), ὥστε καὶ ἡ διὰ τῶν Θ, Η, Ζ εὐθεία ἐστὶν.

^a It is not perhaps obvious, but is easily proved, and is in fact proved by Pappus in the course of iv. 21, ed. Hultsch 212. 4-13, by drawing an auxiliary parallelogram.

^b Conversely, if $HΘΚΑ$ be any quadrilateral, and any

REVIVAL OF GEOMETRY: PAPPUS

Since $AZ : B\Gamma : AB : \Gamma Z = AZ : \Delta E : A\Delta : EZ$,
permutando

$$AZ : B\Gamma : AZ : \Delta E = AB : \Gamma Z : A\Delta : EZ,$$

i.e., $B\Gamma : \Delta E = AB : \Gamma Z : A\Delta : EZ.$

But, if KM be drawn through K parallel to AZ,

$$B\Gamma : \Delta E = (B\Gamma : KN) \cdot (KN : KM) \cdot (KM : \Delta E),$$

and

$$AB : \Gamma Z : A\Delta : EZ = (BA : A\Delta) \cdot (\Gamma Z : ZE).$$

Let the equal ratios $BA : A\Delta$ and $NK : KM$ be eliminated ;

then the remaining ratio •

$$\Gamma Z : ZE = (B\Gamma : KN) \cdot (KM : \Delta E),$$

i.e., $\Gamma Z : ZE = (\Theta\Gamma : K\Theta) \cdot (KH : HE) ;$

then shall the line through Θ, H, Z be a straight line.

For if through E I draw $E\Xi$ parallel to $\Theta\Gamma$, and if ΘH be joined and produced to Ξ ,

$$KH : HE = K\Theta : E\Xi,$$

and $(\Gamma\Theta : \Theta K) \cdot (\Theta K : E\Xi) = \Theta\Gamma : E\Xi,$

∴ $\Gamma Z : ZE = \Gamma\Theta : E\Xi ;$

and since $\Gamma\Theta$ is parallel to $E\Xi$, the line through Θ, Ξ, Z is a straight line (for this is obvious^a), and therefore the line through Θ, H, Z is a straight line.^b

transversal cut pairs of opposite sides and the diagonals in the points $A, Z, \Delta, \Gamma, B, E$, then $B\Gamma : \Delta E = AB : \Gamma Z : A\Delta : EZ$. This is one of the ways of expressing the proposition enunciated by Desargues: *The three pairs of opposite sides of a complete quadrilateral are cut by any transversal in three pairs of conjugate points of an involution* (v. L. Cremona, *Elements of Projective Geometry*, tr. by C. Leudesdorf, 1885, pp. 106-108). A number of special cases are also proved by Pappus.

REVIVAL OF GEOMETRY: PAPPUS

(o) MECHANICS ^a

Ibid. viii., Preface 1-3, ed. Hultsch 1022. 3-1028. 3

The science of mechanics, my dear Hermodorus, has many important uses in practical life, and is held by philosophers to be worthy of the highest esteem, and is zealously studied by mathematicians, because it takes almost first place in dealing with the nature of the material elements of the universe. For it deals generally with the stability and movement of bodies [about their centres of gravity],^b and their motions in space, inquiring not only into the causes of those that move in virtue of their nature, but forcibly transferring [others] from their own places in a motion contrary to their nature; and it contrives to do this by using theorems appropriate to the subject matter. The mechanicians of Heron's school^c say that mechanics can be divided into a *theoretical* and a *manual* part; the theoretical part is composed of geometry, arithmetic, astronomy and physics, the manual of work in metals, architecture, carpentering and painting and anything involving skill with the hands. The man who had been trained from his youth in the aforesaid sciences as well as practised in the aforesaid arts, and in addition has a versatile mind, would be, they say, the best architect and inventor of mechanical devices. But as it is impossible for the same person to familiarize himself with such

number of interesting theoretical problems are solved in the course of the book, including the construction of a cone through five points (viii. 13-17, ed. Hultsch 1072. 30-1081. 2).

^b It is made clear by Pappus later (vii., Pref. 5, ed. Hultsch 1030. 1-17) that *φoρά* has this meaning.

^c With Pappus, this is practically equivalent to Heron himself: cf. vol. i. p. 184 n. b.

τε τοσούτων περιγενέσθαι καὶ μαθεῖν ἅμα τὰς προειρημένας τέχνας παραγγέλλουσι τῷ τὰ μηχανικά ἔργα μεταχειρίζεσθαι βουλομένῳ χρῆσθαι ταῖς οἰκείαις τέχναις ὑποχειρίοις ἐν ταῖς παρ' ἑκάστα χρείαις.

mathematical studies and at the same time to learn the above-mentioned arts, they instruct a person wishing to undertake practical tasks in mechanics to use the resources given to him by actual experience in his special art.

Of all the [mechanical] arts the most necessary for the purposes of practical life are: (1) that of the *makers of mechanical powers*,^a they themselves being called *mechanicians* by the ancients—for they lift great weights by mechanical means to a height contrary to nature, moving them by a lesser force; (2) that of the *makers of engines of war*, they also being called *mechanicians*—for they hurl to a great distance weapons made of stone and iron and such-like objects, by means of the instruments, known as catapults, constructed by them; (3) in addition, that of the men who are properly called *makers of engines*—for by means of instruments for drawing water which they construct water is more easily raised from a great depth; (4) the ancients also describe as *mechanicians* the *wonder-workers*, of whom some work by means of pneumatics, as Heron in his *Pneumatica*,^b some by using strings and ropes, thinking to imitate the movements of living things, as Heron in his *Automata* and *Balancings*,^b some by means of floating bodies, as Archimedes in his book *On Floating Bodies*,^c or by using water to tell the time, as Heron in his *Hydria*,^d which appears to have affinities with the

Belopoeica, ed. Schneider 84. 12, *Greek Papyri in the British Museum* iii. (ed. Kenyon and Bell) 1164 n. 8.

science of sun-dials ; (5) they also describe as mechanicians the *makers of spheres*, who know how to make models of the heavens, using the uniform circular motion of water.

Archimedes of Syracuse is acknowledged by some to have understood the cause and reason of all these arts ; for he alone applied his versatile mind and inventive genius to all the purposes of ordinary life, as Geminus the mathematician says in his book *On the Classification of Mathematics*.^a Carpus of Antioch^b says somewhere that Archimedes of Syracuse wrote only one book on mechanics, that on the construction of spheres,^c not regarding any other matters of this sort as worth describing. Yet that remarkable man is universally honoured and held in esteem, so that his praises are still loudly sung by all men, but he himself on purpose took care to write as briefly as seemed possible on the most advanced parts of geometry and subjects connected with arithmetic ; and he obviously had so much affection for these sciences that he allowed nothing extraneous to mingle with them. Carpus himself and certain others also applied geometry to some arts, and with reason ; for geometry is in no way injured, but is capable of giving content to many arts by being associated with them, and, so far from being injured, it is obviously, while itself

^a For Geminus and this work, v. *supra*, p. 370 n. c.

^b Carpus has already been encountered (vol. i. p. 334) as the discoverer (according to Iamblichus) of a *curve arising from a double motion* which can be used for squaring the circle. He is several times mentioned by Proclus, but his date is uncertain.

^c This work is not otherwise known.

 Aëtius: *Placita*, 217 and n. *c*
 Agorastes, character in Lucian's *Auction of Souls*, 91
 Alexander Aphrodisiensis, 173, 236 n. *a*, 315
 Alexander the Great, 155 n. *b*, 175
 Algebra:
 Geometrical algebra of Pythagoreans, 186-215
 Pure determinate equations, 2. 525
 Quadratic equations: geometrical solution by Pythagoreans, 186-215; solutions by Heron, ii. 503-505 (incl. n. *a*); by Diophantus, ii. 527-535 (esp. ii. 533 n. *b*); v. also Square root, extraction of
 Simultaneous equations leading to a quadratic, ii. 537
 Cubic equations: Archimedes, ii. 127-163 (incl. n. *a*); Diophantus, ii. 539-541; v. also Cube root
 Indeterminate equations: Pythagorean and Platonic formulae for right-angled triangles, 90-95; side and diameter-numbers, 132-139; "bloom" of Thymaridas, 139-141; "cattle problem" of Archimedes, ii. 202-205; Heron, ii. 505-509; Diophantus, ii. 541-551
 Sums of squares, ii. 551-559
 Allman, J. G., his *Greek*

INDEX

- Geometry from Thales to Euclid*, 237 n. b
- Almagest*: Arabic name for Ptolemy's *Syntaxis*, ii. 409 n. b
- Alphabet, Greek: use as numerals, 42-44
- Ameristus, 147 and n. b
- Anthor, A., on Archimedes' cattle problem, 17 n. a, ii. 205 n. b
- Amyclas (see Amyntas) of Ileraclea, 153 and n. b
- Amyntas: v. Amyclas
- Analemma: of Ptolemy, 301 n. b, ii. 409 n. b; of *Diodorus*, 301 and n. b
- Analysis: discussion by Pappus, ii. 597-599; applied by Eudoxus to theory of "the section," 153 and n. a; v. also Leodamas
- Anatolius, bishop of Laodicea: on the meaning of the name *mathematics*, 3; on the Egyptian method of reckoning, 3 n. a, ii. 515-517; the classification of mathematics, 19 and n. b; his relation to Diophantus, ii. 517 n. a
- Anaxagoras: wrote on squaring of circle while in prison, 308, 149 n. d; character in Plato's *Rivals*, 149 n. f
- Anchor-ring, v. Tore
- Angle: angle in semi-circle, 167-169; *mixed* angles, 429 n. c; equality of right-angles, 443 and n. b
- Anharmonic ratios, 485 n. e
- Anthemius of Tralles, ii. 357 n. a
- Anticleides, 175
- Antiphon, 311 and n. a, 313 and n. a, 315 and n. a, 317 n. a
- Apollodorus the Calculator, 169 and n. a
- Apollonius of Perga:
Life: ii. 277 (esp. n. a)-281
Works:
Conics: Relation to previous works, 487-489 (incl. n. a), ii. 277-281; scope of the work, ii. 281-285; terminology, ii. 285-289, ii. 309 and n. a, ii. 317 and n. a, ii. 323; construction of the sections, ii. 289-305; fundamental properties, ii. 305-329—parabola, ii. 305-309, hyperbola, ii. 309-317, ii. 323-329, ellipse, ii. 317-323; transition to new diameter, ii. 329-335; introduction of axes, ii. 289 n. a, ii. 331 n. a; generality of his methods, ii. 289 n. a; form of his proofs, ii. 289 n. a; contrast with Archimedes' treatment, ii. 323 a, and terminology, ii. 283 n. a; his distinctive achievement to have based his treatment on the theory of *applied*

- areas*, ii. 309 n. *a* ;
first to have recognized two branches of
hyperbola, ii. 329 n. *a* ;
focus - directrix property not used, 495
n. *a*, ii. 281 n. *a*
- On the Cutting-off of a Ratio*, ii. 337-339 ;
included in *Treasury of Analysis*, ii. 337 ;
Halley's Latin translation, ii. 337 n. *a*
- On the Cutting-off of an Area*, ii. 339 and n. *b* ;
included in *Treasury of Analysis*, ii. 337
- On Determinate Section*,
ii. 339-341 (incl. n. *a*) ;
included in *Treasury of Analysis*, ii. 337 ;
lemma by Pappus, ii. 607-611
- On Tangencies*, ii. 341-343 (incl. n. *b*) ; problem of three circles and Newton's solution, ii. 343 n. *b* ; included in *Treasury of Analysis*, ii. 337
- On Plans Loci*, ii. 345 and n. *c* ; included in *Treasury of Analysis*, ii. 337 ; reconstructions by Fermat, van Schooten and Simson, ii. 345 n. *c*
- On Vergings*, ii. 345-347 (incl. n. *a*) ; included in *Treasury of Analysis*, ii. 337 ; described the datum as the
assigned, ii. 349 ; restoration by Samuel Horsley, ii. 347 n. *a*
- On the Dodecahedron and the Icosahedron*, ii. 349
- General Treatise*, ii. 349-351 (incl. n. *a*)
- On the Cochlias*, ii. 351 ; "sister of the cochloid," 335 and n. *c*
- On Unordered Irrationals*, 351-353 (incl. n. *a*)
- Quick-deliverer* (on the measurement of a circle), ii. 353 and nn. *b, c*
- On the Burning Mirror*, ii. 357 and n. *b*
- Other mathematical achievements :
Two mean proportionals, 267 n. *b*
Continued multiplications, ii. 353-357
Astronomy, ii. 357 n. *b*
Otherwise mentioned : ii. 363
- Application of Areas, 186-215 ; explanation and history, 186-187 ; a Pythagorean discovery, 187 ; Euclid's theorems, 189-215 ; equivalence to solution of quadratic equations, 195 n. *a*, 197 n. *a*, 211 n. *a*, 215 n. *a* ; possible use by Hippocrates, 245 n. *a* ; use by Apollonius in his treatment of the conic sections, ii. 305-323 (esp. ii. 309 n. *a*)

Approximations to π , 321-333 (incl. n. a), ii. 353

Archibald, R. C., his *Euclid's Book on Divisions of Figures*, 157 n. c

Archimedes

Life: A Syracusan, ii. 19;

born about 287 B.C., ii.

19 and n. c; his me-

chanical devices used in

the defence of Syra-

cuse, ii. 19-21, ii. 25-31;

his death at the hands

of a Roman soldier in

212 B.C., ii. 23, ii. 33-35;

his sayings, ii. 21, ii. 23,

ii. 35; his contempt for

the utilitarian, ii. 31, ii.

619; his request for a

cylinder enclosing a

sphere as a monument,

ii. 33 and n. a; his ab-

sorption in his work, ii.

31-33, ii. 37; his solu-

tion of the problem of

the crown, ii. 37-39, ii.

251 n. a; his Doric

dialect, ii. 21 and n. b,

ii. 137

Works:

On the Sphere and Cylin-

der, ii. 41-127; pre-

face, ii. 41-43; axioms,

ii. 43-45; postulates,

ii. 45-47; surface of

cylinder, ii. 67-77;

surface of cone, ii. 77-

81; surface of sphere,

ii. 113-117; volume

of sphere, ii. 119-127;

trigonometrical equi-

valents, ii. 91 n. b, ii.

101 n. a, ii. 109 n. a;

equivalence to inte-

gration, ii. 41 n. a, ii.

117 n. b; problem

leading to solution of

cubic equation, ii.

127-163 (incl. n. a);

cited by Zenodorus,

ii. 393, ii. 395; Euto-

cius's commentaries,

ii. 73 n. a, ii. 77 n. a,

ii. 127 n. a, ii. 135-

163; otherwise men-

tioned, ii. 165 n. a

On Conoids and Spher-

oids, ii. 165-181; pre-

face, ii. 165; lemma's,

ii. 165-169; volume

of segment of para-

boloid of revolution,

ii. 171-181; equiva-

lence to integration,

ii. 181 n. a

On Spirals, ii. 183-195;

definitions, ii. 183-

185; fundamental

property, ii. 185-187;

vergings assumed, ii.

187-189 (incl. n. c), ii.

195 n. a; property of

sub-tangent, ii. 191-

195, and comments of

Pappus, Tannery and

Heath, ii. 195 n. b;

curve used to square

the circle, 335 and n. b

On the Measurement of

a Circle, 317-333;

Eutocius's commen-

tary, 323 n. a; cited

by Zenodorus, ii. 395

and n. a

INDEX

Quadrature of a Parabola, ii. 229-243; prefatory letter to Dositheus, ii. 229-233; first (mechanical) proof of area of parabolic segment, ii. 233-239; equivalence to integrations, ii. 239 n. b; second (geometrical) proof, ii. 239-243; otherwise mentioned, ii. 41 n. b, ii. 221 n. a, ii. 225 and n. b

Method, ii. 221-229; discovery by Heiberg, ii. 221 n. b; prefatory letter to Eratosthenes, ii. 221-223; mechanical proof of area of parabolic segment, ii. 223-229; gives Democritus credit for finding volume of cone and pyramid, 229-231, 411 n. a

Sand-reckoner, ii. 199-201 (incl. n. a)

Cattle Problem, 17 n. c, ii. 203-205 (incl. n. a)

On Plane Equilibriums, ii. 207-221; postulates, ii. 207-209; principle of lever, ii. 209-217; centre of gravity of parallelogram, ii. 217-221; of a triangle, ii. 227 and n. a

On Floating Bodies, ii. 243-257; discovery of

Greek text by Heiberg, ii. 242 n. a; William of Moerbeke's Latin translation, ii. 242 n. a; postulates, ii. 243-245; surface of fluid at rest, ii. 245-249; loss of weight of solid immersed in a fluid - "Archimedes' principle," ii. 249-251; use of this principle to solve problem of crown, ii. 251 n. a; stability of paraboloid of revolution, ii. 253-257; Heath's tribute to Book ii., ii. 252 n. a
Liber Assumptorum, ii. 581 n. a

Other achievements:

Discovery of 13 semi-regular solids, 217 n. a, ii. 195-197 (incl. n. b)

Circles inscribed in the $\alpha\rho\beta\eta\lambda\omicron\varsigma$, ii. 581 n. a

Solution of cubic equations, ii. 127-163 (incl. n. a)

Inequalities, ii. 165-169

Summation of series, ii. 165-169, ii. 241 and n. a

"Archimedes' Axiom," 321 n. a, 411 n. a, 455 n. a, ii. 47 and n. a, ii. 195 n. b, ii. 231

Otherwise mentioned: Vitruvius on his proficiency in all branches of science, ii. 3 n. a;

INDEX

- Pappus's tribute to his versatility, ii. 619; his method of evaluating areas, ii. 585 n. a
- Archytas, 5 n. a; on the branches of mathematics (Pythagorean *quadrivium*), 5 and n. b; on means, 113-115, 153 n. a; his proof that a super-particular ratio cannot be divided into equal parts, 131-133; Proclus's comments on his work in geometry, 151; his solution of the problem of two mean proportionals, 285-289; his work in stereometry, 7 n. a, 13 n. b; his method of representing the sum of two numbers, 131 n. c, 429 n. c
- Aristaeus: his five books of *Solid Loci* (conic sections), 487 and n. a, ii. 281 n. a, ii. 255 n. a; first demonstrated focus-directrix property, 495 n. a; his (?) *Comparison of the Five Regular Solids*, 487 n. b
- Aristarchus of Samos, ii. 3-15; a pupil of Strato of Lampsacus, ii. 3 and n. a; his theory of the nature of light, ii. 3; his heliocentric hypothesis, ii. 3-5 (incl. n. b); on the sizes and distances of the sun and moon, ii. 3-15; use of continued fractions (?), ii. 15 and n. b
- Aristophanes: reference to the squaring of the circle, 309 and n. a
- Aristotle: use of term *mathematics*, 3 n. c, 401 n. a; did not know how to square the circle, 335; on first principles of mathematics, 419-423; on the infinite, 425-429; proofs differing from Euclid's, 419 n. a, 429-431; method of representing angles, 429 n. c; on the principle of the lever, 431-433; on the parallelogram of velocities, 433; irrationality of $\sqrt{2}$, 111; on odd, even and prime numbers, 75 n. a, 78 n. a; on oblong and square numbers, 95 and n. b; on Zeno's paradoxes of motion, 366-375; on nature of geometrical proof, ii. 369
- Aristoxenus: on Plato's lecture on the Good, 389-391; his pupil Cleonides, 157 n. c
- Arithmetic:
Its place in the Pythagorean *quadrivium*, 5 and n. b; in the education of Plato's Guardians, 7-9; in Plato's *Lysis*, 21-23; in Anaxagoras and Geminus, 19 and n. b; difference from logistic, 7 and n. a, 17-19 (incl. n. b); Greek arithmetical notation and the chief arithmetical operations, 41-63

INDEX

Pythagorean arithmetic:
first principles, 67-71;
classification of num-
bers, 73-75; perfect
numbers, 75-87; figured
numbers, 87-99; some
properties of numbers—
the "sieve" of Eratos-
thenes, 101-103, divisi-
bility of squares, 103-
105; a theorem about
cube numbers, 105-107;
a property of the pyth-
men, 107-109; irration-
ality of $\sqrt{2}$, 111; theory
of proportion and means
—arithmetic, geometric
and harmonic means,
111-115, seven other
means, 115-125, Pap-
pus's equations between
means, 125-129, Plato
on means between two
squares or two cubes,
129-131, Archytas's
proof that a superpar-
ticular ratio cannot be
divided into equal parts,
131-133

INDEX

Circle :

Division into degrees, ii.
305-397

Squaring of the circle :
Anaxagoras's work in
prison, 309 ; a reference
by Aristophanes, 309 ;
approximation by poly-
gons — Antiphon, 311-
315, Bryson, 315-317,
Archimedes, 317-333 ;
solutions by higher
curves — Simplicius's
summary, 335, the
quadratrix, 337-347 ;
closer approximations
by Archimedes, 333 n. a,
and Apollonius, ii. 353 ;
Pappus's collection of
solutions, ii. 581 n. b

Apparent form of circle,
ii. 593-597

Cisoid, viii ; discovered by
Diocles, 271 n. a, ii. 365
n. a ; and by him used for
finding two mean propor-
tionals, 271-279

Cleanthes, ii. 5

Cleomedes : life and works,
ii. 267 n. b, ii. 397 n. a ;
on the measurement of
the earth, ii. 267-273 ; on
paradoxical eclipses, ii.
397-401

Cleonides, 157 n. c

Cochlias, 335, ii. 351

Cochloids, 301 n. a, 335 and
n. c, 297 n. c

Commandinus, his edition of
Pappus's *Collection*, 499
n. a, ii. 581 n. c

Concentric spheres, Eu-

doxus's theory of, 411-
415

Conchoid, 297, 301 n. a ;
used by Nicomedes to
trisect an angle, 297-309

Cone : double cone defined
by Apollonius, ii. 285-287 ;
single cone defined, ii.
287 ; volume enunciated
by Democritus, 229-231 ;
and proved by Eudoxus,
229-231, 409-411 ; sub-
contrary section a circle,
ii. 301 n. a

Conic sections : discovered
by Menæchmus, 279-283
(incl. n. a), 297, ii. 281 n.
a ; originally called sec-
tions of a right-angled,
acute-angled and obtuse-
angled cone, 283 n. a, ii.
279 ; by Apollonius re-
named parabola, ellipse
and hyperbola, 283 n. a ;
treatises written by Aris-
taeus and Euclid, 487 and
n. a, ii. 255 n. a, ii. 281 n.
a ; "locus with respect to
three or four lines," 487-
489 ; Euclid on genera-
tion of ellipse, 491 ; focus-
directrix property assumed
by Euclid, 495 and n.
a ; terminology of Archi-
medes, ii. 281 n. a, ii. 283
n. a ; area of parabolic
segment found by Archi-
medes mechanically, ii.
223-227, ii. 233-239, geo-
metrically, ii. 239-245 ;
properties assumed by
Archimedes, ii. 171, ii. 175,

ii. 253, ii. 255; relation of Apollonius's treatise to previous works, ii. 277-281; scope of his treatise, ii. 281-285; definitions, ii. 285-289; construction of the sections, ii. 289-305; fundamental properties, ii. 305-329; meaning of *diameter*, ii. 287; ordinates, ii. 289; conjugate diameters, ii. 289; transition to new diameter, ii. 329-335; principle axes, ii. 289 and n. a, ii. 331 n. a; conjugate axes, ii. 289; opposite branches of hyperbola, ii. 323-329 (incl. n. a); basis of Apollonius's treatment the application of areas, ii. 309 n. a; "figure" of a conic section, ii. 317 n. a; *latus rectum*, ii. 309 and n. a, ii. 317 and n. a; transverse side, ii. 317 and n. a; Cartesian equivalents, 283 n. a, ii. 323 n. a; use of conic sections to solve cubic equations—by Archimedes, ii. 137-159; by Dionysodorus and Diocles, ii. 163 n. a; to find two mean proportionals, 279-283; to trisect an angle, 357-363

Conon of Samos, ii. 35 n. b, ii. 229

Conversion, in geometry, 159 and n. a

Cube: one of five regular solids, 217, 223, 379, 467-475; inscription in sphere

by Pappus, ii. 575 n. a; duplication of cube—task set to Delians and Plato's advice sought, 257; a poetic version, 257-259; reduced to finding of two mean proportionals, 259; collection of solutions by Eutocius, 263 n. a; by Pappus, ii. 581 n. b

Cube root: $\sqrt[3]{100}$ found by Heron, 61-63; Heron's value for $\sqrt[3]{97050}$, 63 n. a; approximations by Philon of Byzantium, 63 n. a

Cubic equations: c.e. arising out of Archimedes' *De Sph. et Cyl.*, ii. 133 n. d; solved by Archimedes by use of conics, ii. 137-159 (esp. 141 n. a); also by Dionysodorus and Diocles, ii. 163 n. a; Archimedes able to find real roots of general cubic, ii. 163 n. a; cubic equation solved by Diophantus, ii. 539-541

Damianus of Larissa, ii. 497 n. a; his book *On the Hypotheses in Optics*, ii. 497; an abridgement of a larger work based on Euclid, ii. 497 n. a

Definitions: discussed by Plato, 393; by Aristotle, 423; Euclid's d., 67-71, 437-441, 445-453, 479; Archimedes' d., ii. 43-45, ii. 165, ii. 183-185; Apollonius's d., ii. 285-289;

INDEX

- Heron's d., ii. 467-471; Diophantus's d., ii. 519-523
- De Fortia D'Urban, Comte, his *Traité d'Aristarque de Samos*, ii. 15 n. b
- Demel, Seth: his *Platons Verhältnis zur Mathematik*, 387 n. a
- Demetrius of Alexandria, 349 and n. b
- Democritus: life and works, 229 n. a; reflections on the indefinitely small, 229; enunciated formulæ for volumes of cone and pyramid, 229-231, 411 n. a
- De Morgan, 447 n. a
- Descartes, system of co-ordinates conceived through study of Pappus, ii. 601 n. a
- Dichotomy of Zeno, 369 and n. b
- Diels, H.: his *Die Fragmente der Vorsokratiker*, xvi, 5, 73, 75, 113, 173, 217
- Digamma: use as numeral, 43
- Dimension, 85, ii. 411-413, ii. 515, ii. 601-603
- Dinostratus, 153 and n. d
- Diocles: his date, ii. 365 n. a; his discovery of the cissoid, viii, 270-279: his solution of a cubic equation, ii. 135, ii. 163 n. a
- Diodorus of Alexandria: his *Analemma*, 301 and n. b
- Diodorus Siculus: his account of the siege of Syracuse, ii. 23 and n. a
- Dionysius, a friend of Heron, ii. 467
- Dionysodorus: of Caunus?, ii. 364 n. a; his solution of a cubic equation, ii. 135, ii. 163 n. a; his book *On the Spire*, ii. 481
- Diophantus of Alexandria: life, ii. 513, ii. 517 n. b; on the unit, ii. 515; on the Egyptian method of reckoning, ii. 515; his *Arithmetica*, ii. 517 and n. b; his work (?) entitled *Porisms*, ii. 517 and n. c; his treatise *On Polygonal Numbers*, ii. 515, ii. 561; his contributions to algebra—notation, ii. 519-525; pure determinate equations, ii. 525; quadratic equations, ii. 527-535, esp. ii. 533; simultaneous equations leading to a quadratic, ii. 537; cubic equation, ii. 539-541; indeterminate analysis, 130 n. b; indeterminate equations of the second degree, ii. 541-547; indeterminate equations of higher degree, ii. 549-551; theory of numbers—sums of squares, ii. 551-559
- Dioptra: ancient theodolite, ii. 467; Heron's book, ii. 485-489
- Diorismi, 151 and n. h, 305-307, ii. 135 n. a
- Division in Greek mathematics, 51-61
- Division of Figures: Euclid's book, 157 n. c; a problem in Heron's *Metrica*, ii. 483-485

Dodecahedron: one of the five regular solids, 217, 223 and n. b; Hippasus said to have been drowned for revealing it, 223-225; comparison with the icosahedron, ii. 349

Dositheus of Pelasium: works dedicated to him by Archimedes, ii. 41, ii. 229

Dyad, 75 and n. a, 427 n. b

Earth: circumference calculated by Posidonius, ii. 267; by Eratosthenes, ii. 267-273

Ecliptic, 149 n. e

Euphantus, ii. 5 n. b

Eecke, Paul Ver, v. Ver Eecke

Egyptian method of reckoning, 17, 21, ii. 515-517

Egyptian papyri, calculations in, 45-47

Egyptian *se-qed*, 165 n. b

Elements: meaning of term, 151 n. c; Leon's collection, 151; Euclid's *Elements*, 157, 437-479; *Elements of Conics*, 487 n. a, ii. 151, ii. 153; Pappus's *Collection* so described, ii. 607

Eneström, G., 63 n. a

Enneagon: relation of side of enneagon to diameter ($=\sin 20^\circ$), ii. 409 n. a

Epanthema, "bloom," of Thymaridas, 139-141

Equations: v. Cubic equations, Quadratic equations

Eratosthenes: Life and achievements, 156 and n. a,

ii. 261 and n. a; his work *On Means* included in the *Treasury of Analysis*, ii. 263 and n. d; discussed, *loci with reference to means*, ii. 263 n. d, ii. 265 and n. a; his *Platonicus*, 257 and ii. 265-267; his *sieve* for finding successive odd numbers, 100-103; letter of pseudo-Eratosthenes to Ptolemy Euergetes, 257-261; his solution of the problem of two mean proportionals, 291-297; his solution derided by Nicomedes, 297-299; his measurement of the circumference of the earth, ii. 267-273; Archimedes' *Method* dedicated to him, ii. 221; *Cattle Problem* said to have been sent through him, ii. 203; his teachers and pupils, ii. 261-263; his nicknames, ii. 261-263; his other works, ii. 263

Erycinus, Paradoxes of, ii. 571-573

Euclid:

Life: Born in time of Ptolemy I, 155 and n. b; not to be confused with Euclid of Megara, 155 n. b; his school at Alexandria, 437 n. a, 489, ii. 35 n. b; told Ptolemy there was no royal road in geometry, 155 (but v. n. b); contempt for those who

studied mathematics for monetary gain, 437

Works :

Elements : meaning of the name, 151 n. c, Proclus's notice, 155-157 ; definitions, postulates and common notions, 437-445 ; "Pythagoras's Theorem," 179-185 ; application of areas, 187-215 ; theory of proportion, 445-451 ; arithmetical definitions, 67-71 ; theory of incommensurables, 451-459 ; method of exhaustion, 459-465 ; regular solids, 467-479 ; Proclus's commentary on Book i., 145 n. a ; an-Nairizi's commentary, 185 n. b ; Scholia, 215-217, 379, 409 ; T. L. Heath, *The Thirteen Books of Euclid's Elements* : n. Heath, T. L. : *The Thirteen Books*, etc.

Data : General character, 479 n. a ; definitions, 479 ; included in *Treasury of Analysis*, 479 n. a, ii. 337 ; cited, ii. 455

Porisms : Proclus's notice, 481 ; included in *Treasury of Analysis*, 481 and n. c, ii. 337 ; Pappus's comprehensive enuncia-

tion, 481-483 ; developments in theory of conics, 487 n. a ; modern reconstructions, 485 n. e ; a lemma by Pappus, ii. 611-613

Conics : a compilation based on Arislaeus, ii. 281 n. a ; Pappus on Apollonius's debt, 487-489 ; Ellipse obtained as section of cone or cylinder by a plane not parallel to the base, 491 and n. b ; focus-directrix property assumed without proof, 495 n. a ; cited by Archimedes, ii. 225

Surface Loci : 399 n. a, 487 n. a ; included in *Treasury of Analysis*, 491 and n. c ; Pappus's lemmas, 363 n. a, 493-503

Optics : Euclid's text and Theon's recension, 503 and n. b, 157 and n. c ; proof that $\tan \alpha : \tan \beta < \alpha : \beta$, 503-505

On Divisions of Figures : Proclus's notice, 157 ; Woepcke's discovery of Arabic text, 157 n. c ; R. C. Archibald's restoration, 157 n. c ; a medieval Latin translation (by Gherard of Cremona?),

157 n. c; similarity of Book iii. of Heron's *Metrics*, ii. 485 n. a; division of a circle into three equal parts, ii. 485 n. a

Pseudaria: attributed to Euclid by Proclus, 161 and n. a

Catoptrics: attributed to Euclid by Proclus, 157; but not otherwise known, and possibly written by Theon of Alexandria, 157 n. c

Phenomena: astronomical treatise, 491 n. a

Sectio Canonis, musical treatise doubtfully attributed to Euclid, 157 n. c

Introductio Harmonica, musical treatise by Cleonides, wrongly attributed to Euclid, 157 n. c

Elements of Music: attributed to Euclid by Proclus, 157

Euclidean geometry, viii; its nature defined in the postulates—space an infinite, homogeneous continuum, 443 and n. a, b, the parallel-postulate, 443 and n. c; Proclus's objection to the postulate, ii. 367-371; attempts to prove the postulate—Posidonius and Geminus, ii. 371-373, Ptolemy, ii. 373-383, Proclus, ii. 383-385;

Euclid's genius in making it a postulate, 443 n. c, ii. 367 n. a; non-Euclidean geometry, 443 n. c

Eudemus: pupil of Aristotle, 145 n. a, ii. 281; his *History of Geometry*, 145 n. a; his account of Hippocrates' quadrature of lunes, 235-253; on sum of angles of a triangle, 177-179; attributed Eucl. xii. 2 to Hippocrates, 239, 459 n. a

Eudemus, correspondent of Apollonius: *Conics* dedicated to him, ii. 281

Eudoxus of Cnidos: Proclus's notice, 151-153; discovered three subcontrary means, 153; increased theorems about "the section," 153; established theory of proportion, 409; credited with discovery of three subcontrary means, 121 n. a; gave proofs of volume of pyramid and cone, 109-111; must have used "Axiom of Archimedes," 411 n. a, ii. 231; established method of *exhausting* an area by polygons, 411 n. a; his theory of concentric spheres to account for planetary motions, 411-415; Menacchmus his pupil, 153; his work continued by Hermotimus of Colophon, 153; otherwise mentioned, 349 n. c

INDEX

Eugenius Siculus, Admiral,
translated Ptolemy's *Optics*
into Latin, ii. 411 n. a

Euclid, 259 n. a

Eutocius: *On Archimedes'*
Sphere and Cylinder, 263
nn. a and b, 277 n. a,
299 n. a, ii. 159 n. a, ii.
163 n. a, ii. 621 n. a;
On A.'s Measurement of
a Circle, 323 n. a

Exhaustion, method of:
originated by Antiphon,
315 n. a; or possibly by
Hippocrates, 411 n. a;
established by Eudoxus,
315 n. a, 411 n. a; used to
prove that circles are to
one another as the squares
on their diameters, 239
n. b, 459-465; used for
approximating to area of
circle, 313-315

Fermat: reconstruction of
Apollonius's *On Plane*
Loci, ii. 345 n. c; his notes
on Diophantus, ii. 551 n. a;
sums of squares, ii. 559
n. b

Fractions in Greek mathe-
matics, 45

Geoponicus, Liber, ii. 467
n. a, ii. 505 n. b

Geminus: life and works, ii.
371 n. c; on the classi-
fication of curves, ii. 361-
363, ii. 365 nn. a and b;
his attempt to prove the
parallel-postulate, ii. 371
n. c

Geometric mean: v. Means
Geometry: origins of, 145
(incl. n. b)-146; Proclus's
summary, 145-161; Plato
on its nature, 9-11; in-
cluded in theoretical part
of mechanics by Heron, ii.
615; for detailed subjects
v. Table of Contents

Gnomon: in sundials, 87
n. a, ii. 269-271; gnomons
of dots in figured numbers,
87 n. a, 93 n. a, 95 and
n. b, 99 and n. a; gnomon
of a parallelogram, 193
and n. b, 197 n. a

Gow, J., *A Short History of*
Greek Mathematics, 43 n. b

Guldin, Paul, ii. 605 n. a

Guldin's Theorem, ii. 605
(incl. n. a)

Halley, E., 485 n. b, ii. 337
n. a, ii. 339 n. b

Harmonic mean: v. Means
Heath, T. L. (later Sir
Thomas):

A History of Greek Mathe-
matics, x, xvi, 5 n. b, 23
n. a, 27 n. c, 35 nn.
a and b, 43 n. b, 93 n. a,

A Manual of Greek Mathematics, 181 n. a
The Thirteen Books of Euclid's Elements, 67
 n. a, 71 n. b, 85 n. a, 155
 n. b, 159 n. b, 167 n. b,
 181 n. a, 195 n. a, 211
 n. a, 215 n. a, 437 n. a
 and c, 441 n. a, 447 n. a,
 457 n. a, ii. 367 n. a
Aristarchus of Samos, 411
 n. b, 415 n. c, ii. 3
 n. a
The Works of Archimedes,
 17 n. c, 61 n. b, 323 n. a,
 351 n. b, 493 n. b, ii. 25
 n. a, ii. 117 n. b, ii. 163
 n. a, ii. 181 n. a, ii.
 205 n. b
The Method, ii. 19 n. a
Apollonius of Perga, ii.
 281 n. a
Diophantus of Alexandria,
 139 n. b, ii. 513 n. a,
 ii. 517 n. c, ii. 519 n. a,
 ii. 523 n. a, ii. 537 n. b
Greek Astronomy, 157 n. a,
 411 n. b
 Heibien, J. L., 333 n. a
 Heiberg, J. L., 19 n. c, 297
 n. a, 311 n. b, 487 n. b,
 503 n. b, ii. 81 n. a, ii. 85
 n. a, ii. 89 n. a, ii. 159 n. a,
 ii. 173 n. a, ii. 221 n. b, ii.
 243 n. a, ii. 285 n. a, ii.
 353 n. c, ii. 357 n. a, ii. 466
 n. a

Helicon of Cyzicus, 263 n. b
 Hendecagon, ii. 409 n. a
 Heraclides of Pontus, ii. 5 n. b
 Hermodorus, corresponden?
 of Pappus, ii. 597
 Hermotimus of Colophon,
 153 and n. c
 Herodotus, on the abacus, 35
 Heron of Alexandria:
 Life: his date a disputed
 question, ii. 467 n. a;
 described as "the father
 of the turbine," ii. 467
 n. a
 Works, ii. 467 n. a:
Definitions: based on
 Euclid, ii. 467; de-
 finition of a point, ii.
 469; of a spire, ii.
 469; his terminology
 different from Pro-
 clus's, ii. 471 n. a
Metrica: discovery by
 R. Schöne and edited
 by his son H. Schöne,
 ii. 467 n. a; has pre-
 served its original
 form more closely
 than Heron's other
 geometrical works, ii.
 467 n. a; formula
 $\sqrt{s(s-a)(s-b)(s-c)}$
 for area of a triangle,
 ii. 471-477, ii. 603
 n. a; formula for
 approximation to a
 square root, ii. 471-
 472 (incl. n. a);
 volume of a spire, ii.
 477-483; division of
 a circle into three
 equal parts, ii. 483-

485; similarity between Book iii. and Euclid's book *On Divisions of Figures*, ii. 485 n. a; extraction of a $\sqrt[3]{100}$, 60-68; Archimedes' approximation to π , 333

Dioptra: the dioptra, an instrument like a theodolite, ii. 467 n. a; measurement of an irregular area, ii. 485-489; problem of moving a given force by a given weight using an arrangement of toothed wheels, ii. 489-497; similar solutions found in the *Mechanics* and in Pappus, ii. 489 n. a; proof of formula for area of a triangle, ii. 477 n. a

Mechanics: has survived, in Arabic, ii. 488 n. a, and in a few fragments of the Greek, ii. 467 n. a; problems discussed, ii. 489 n. a

Geometrica: quadratic equations, ii. 503-505; indeterminate analysis, ii. 505-509

Pneumatica, *Automata*, etc., ii. 467 n. a, ii. 617

Otherwise mentioned: his addition to "Pythagoras's Theorem," 181 n. a and 185 n. b; his

solution of the problem of two mean proportionals, 267-271; possible censure by Pappus, ii. 603 and n. a; on branches of mechanics, ii. 615

Hexagon, its use by bees, ii. 589-593

Hipparchus: life and achievements, ii. 407 n. a; founded the science of trigonometry, ii. 407 n. a; drew up a table of sines, ii. 407 and n. a; discovered precession of the equinoxes, ii. 407 n. a; his *Commentary on the Phenomena of Eudoxus and Aratus*, ii. 407 n. a, ii. 415 n. a

Hippasus, a Pythagorean: credited with discovery of means, 153 n. a; said to have been drowned at sea for revealing secret of inscribing a dodecahedron in a sphere, 223-225 (incl. n. a)

Hippias of Elis: life and achievements, 149 n. a; his praise of Ameristus, 149; discovered the quadratrix, 149 n. a, 337 n. a

Hippocrates of Chios: life and achievements, 235; his quadrature of lunes, 235-253; the views of Aristotle and the commentators on his quadratures, 311 and n. b; first reduced the problem of doubling the cube to the

- problem of finding two mean proportionals, 253, 259; possibly able to solve a quadratic equation, 245 n. a; discovered that circles are to one another as the squares on their diameters, 239 and n. b, 459 n. a
- Hippopede ("horse-fetter"), name given by Eudoxus to a curve, 415
- Homer, 31 n. a
- Horsley, S., ii. 347 n. a
- Hultsch, F.: his edition of Pappus's *Collection*, ii. 565 n. a, ii. 581 n. c, ii. 605 n. b, ii. 611 n. c
- Hypatia: daughter of Theon of Alexandria, 48 n. a; helped him in revision of commentary on Ptolemy, 48 n. a; her commentary on Apollonius's *Conics*, ii. 285 n. a; her commentary on Diophantus's *Arithmetica*, ii. 517 n. b
- Hypotenuse: square on, 179-185; parallelogram on, ii. 575-579
- Hypsicles: date, ii. 397 n. a; his division of the circle into 360 degrees, ii. 395-397; his continuation of Euclid's *Elements*, ii. 340 nn. a and c, ii. 397 n. a; his definition of a polygonal number, ii. 397 n. a, ii. 515 and n. b
- Iamblichus: on squaring of the circle, 335; on the "bloom" of Thymaridas, 139 n. b; on a property of the *pythmen*, 109 n. a
- Icosahedron, 221 and n. a, ii. 349
- Incommensurable: v. Irrational
- Indeterminate analysis: Pythagorean and Platonic formulae for right-angled triangles, 90-95; side- and diameter - numbers, 133-139; Archimedes' *Cattle Problem*, ii. 202-205; Heron's problems, ii. 505-509; Diophantus's problems, ii. 541-551
- Indian mathematics, 181 n. a
- Involution, ii. 341 n. a, ii. 611 n. a
- Irrational: Pythagoreans and the irrational, 149 n. c, 215-217, 225 n. a; "irrational diameters," 133-137 (esp. n. a), 399 n. c; proof by Theodorus and Theaetetus of irrationality of $\sqrt{3}$, $\sqrt{5}$. . . $\sqrt{17}$, 381-383; Plato on irrational numbers, 401-403; Aristotle's proof of irrationality of $\sqrt{2}$, 111; Euclid's theory, 451-459; Apollonius's theory of unordered irrationals, ii. 351
- Isocrates: on mathematics in Greek education, 27-29
- Isoperimetric figures, ii. 387-395, ii. 589-593
- Karpinski, L. C., 75 n. a

INDEX

Keil, 43 n. *b*
 Kepler, his investigation of
 semi-regular solids, ii.
 197 n. *b*; on planets, 411 n. *b*
 Koppa, used as numeral, 43
 Kubitschek, 35 n. *b*

Laird, A. G., on Plato's
 nuptial number, 309 n. *b*
 Larfeld, W., on Greek alpha-
 bet, 42 n. *b*

Lemmas: Pappus's collec-
 tion, ii. 607 (incl. n. *b*) - 613,
 ii. 565 n. *a*, 493-503;
 lemmas to Menelaus's
 Theorem, ii. 447-459

Leodamas of Thasos: Pro-
 clus's notice, 151; Plato
 said to have communi-
 cated method of analysis
 to him, 151 n. *a*

Leon: made collection of
Elements, and discovered
diorismi, 151 and n. *h*

Line: defined, 437; straight
 line, 439 and n. *a*; different
 species of curved lines ii.
 361-363

"Linear" loci and prob-
 lems, 349

"Linear" numbers, 87 n. *a*

Loci: line loci, surface loci,
 and solid loci, 491 - 493
 (incl. n. *a*); *Surface Loci* of
 Euclid, 349 and n. *a*, 487
 n. *a*, ii. 601; *Solid Loci*
 of Aristaeus, 487, ii. 601

Locus with respect to three
 or four lines, 487-489;
 with respect to five or six
 lines, ii. 601-603

Logistic, 7, 17-19

Loria, G.: his *Le scienze
 esatte nell' antica Grecia*,
 47 n. *a*, 109 n. *a*, 139 n. *b*,
 271 n. *a*

Lucian, 91 n. *a*

Mamercus, 147 n. *b*

Marinus, his commentary on
 Euclid's *Data*, ii. 349, ii.
 565 n. *a*

Mathematics, meaning of the
 term, 3, 401 n. *a*

Means: three Pythagorean
 means — arithmetical, geo-
 metric, subcontrary, 111-
 115; subcontrary renamed
 harmonic, 113; three sub-
 contrary means added,
 119-121 (incl. n. *a*); five
 further means discovered,
 121-125; Pappus's equa-
 tions between means, 125-
 129; Plato on means be-
 tween two squares or two
 cubes, 129-131; duplica-
 tion of cube reduced to
 problem of two mean pro-
 portionals, 259 and n. *b*;
 solutions, 261-309; Era-
 tosthenes' work *On Means*,
 ii. 263; loci with reference
 to means, ii. 265 and n. *a*;
 representation of means by
 lines in a circle, ii. 569-571
 (incl. n. *a*)

Mechanics: Pappus on
 branches of mechanics, ii.
 615-621; principle of lever,
 431-432, ii. 209-217; paral-
 lelogram of velocities, 433;
 centres of gravity, ii. 207-
 221; five mechanical

- powers, ii. 489 n. a; Archimedes' mechanical inventions, ii. 19-31; movement of larger weight by smaller by use of engaging wheels, ii. 489-497; Plato's dislike of mechanical solutions, 263 n. b; Archimedes' preference for theoretical mathematics, ii. 31, ii. 619; pseudo-Aristotelian *Mechanics*, 431-433; Archimedes' *On Plane Equilibriums*, ii. 207-221; his mechanical method in mensuration, ii. 221-229, ii. 233-239; Heron's *Mechanics*, ii. 467 n. a, ii. 489 (incl. n. a) -497
- Menaechmus: solution of problem of two mean proportionals, 261, 279-283; discovered the conic sections, 283 n. a, 297 and n. b, ii. 281 n. a
- Menclaus of Alexandria: made an observation under Trajan, ii. 407 n. a; discovered a curve called "paradoxical," 348-349 (incl. n. c); his *Sphaerica*, ii. 407 n. a, ii. 463 n. a; drew up a table of sines, ii. 407; "Menclaus's Theorem," ii. 459-463
- Mensuration: area of triangle given the sides, ii. 471-477; volume of spire, ii. 477-483; measurement of irregular area, ii. 485-489; area of parabolic segment, ii. 223-229, ii. 243
- Meton, 309 and n. a
- Metrodorus, ii. 513 n. a
- Minus, Diophantus's sign for, ii. 525
- Moeris, 175
- Multiplication in Greek mathematics, 48; Apollonius's continued multiplications, ii. 353-357
- Music: theoretical music (canonic) included by Greeks in mathematics, x, 3 n. b, 19 n. b; full discussion excluded, x; included in Pythagorean *quadrivium*, 5; in Plato's curriculum for the Guardians, 17; popular music, 3, 19
- Musical interval, 3 n. b, 113 n. b, 175
- Myriad; notation, 44-45; orders and periods of myriads in Archimedes' notation, ii. 199-201
- Nagl, A., 35 n. b
- an-Nairizi, Arabic commentator on Euclid's *Elements*, 185 n. b, ii. 467 n. a
- Neoclides, 151 and n. h
- Nesselmann, G. F., his *Die Algebra der Griechen*, 139 n. a, ii. 513 n. a, ii. 517 n. b
- Newton, Sir Isaac, ii. 343 n. b
- Nicolas Rhabdas: v. Rhabdas
- Nicomachus of Gerasa, 67 n. b, 69 nn. a and c, 75 n. a, 79 n. a, 81 n. a, 87 n. a, 95 n. b, 101 n. a, 103 n. a, 105 n. a, 107 n. a, 121 n. a, 123 n. c

INDEX

Nicomedes : date, 297 n. c ;
his conchoid and its use for
finding two mean propor-
tionals, 297-309

* Nix, L., ii. 285 n. a

Number : defined by Euclid,
67 ; by Nicomachus, 73 ;
fundamental concepts, 67-
71 ; Plato on nature of
number, 7 ; his nuptial
number, 399 ; on genera-
tion of numbers, 401-405 ;
odd and even numbers,
67-69, 101, 391 ; prime
numbers, 69, 87 n. a, 101-
103 ; classification of num-
bers, 71, 73-75 ; perfect
numbers, 71, 75-87 ; figured
numbers, 87-99 ; some
properties of numbers, 101-
109 ; Diophantus on sums
of squares, ii. 551-559 ; on
polygonal numbers, ii. 515,
ii. 561

Numerals, Greek, 41-45

" Oblong " numbers, 95 (incl.
n. b)

Octads, in Archimedes' sys-
tem of enumeration, ii.
199-201

Octahedron, one of the five
regular solids, 217, 221
and n. d

Odd and even numbers : v.
Number

Oenopides of Chios, 149 and
n. c

* Olympiodorus, proof of
equality of angles of inci-
dence and reflection, ii.
503 n. a

Optics : Euclid's treatise,
157 n. c, 503 n. b ; his
theorem about apparent
sizes of equal magnitudes,
503-505 ; Ptolemy's treat-
ise, ii. 411 and n. a, ii. 503
n. a ; Heron's treatise, ii.
503 n. a ; his proof of
equality of angles of inci-
dence and reflection,
ii. 497-503 ; Damianus's
treatise, ii. 497 n. a

Pamphila, 167-169 (incl.
n. a)

Pappus of Alexandria :

Life : Suidas's notice, ii.
565-567 ; date, ii. 565
and n. a

Works :

Synagoge or *Collection*,
145 n. a, ii. 565 n.
a ; contents—Apollon-
ius's continued multi-
plications, ii. 353-357 ;
problems and theo-
rems, ii. 567-569 ;
theory of means,
ii. 569-571 ; equa-
tions between means,
125-129 ; paradoxes
of Erycinus, ii. 571-
573 ; regular solids,
ci. 573-575 ; extension
of Pythagoras's theo-
rem, ii. 575-579 ;
circles inscribed in the
ἀρβηλος, ii. 579-581 ;
duplication of the
cube, 299-309 ; squar-
ing of the circle, 337-
347 ; spiral on a

- sphere, ii. 581-587 ;
 trisection of an angle,
 347-363 ; Isoperimet-
 ric figures, ii. 549-593 ;
 application of a
 circle, ii. 593-597 ;
 "Treasury of Analy-
 sis," ii. 597, ii. 599-
 601, 479 n. a, 481 n. c,
 491 n. c, ii. 263, ii. 337 ;
 on the works of Apol-
 lonius, ii. 337-347,
 487-489 ; locus with
 respect to five or six
 lines, ii. 601-603 ; an-
 ticipation of Guldin's
 theorem, ii. 605-607 ;
 lemmas to the *Deter-
 minate Section* of Apol-
 lonius, ii. 607-611 ; to
 the *Porisms* of Euclid,
 ii. 611-613 ; to the
Surface Loci of Eu-
 clid, 493-503 ; me-
 chanics, ii. 615-621
 Commentary on Pto-
 lemy's *Syntaxis*, 48,
 ii. 409 n. b, ii. 565-567,
 ii. 617 n. d
 Commentary on Euclid's
Elements, ii. 565 n. a,
 457 n. a
 Commentary on *Ana-
 lemma* of Dioflorus,
 301, ii. 565 n. a
 Other works, ii. 565
 (incl. n. a), 567
 Paradoxes of Erycinus, ii.
 571-573
 Parallelogram of velocities,
 433
 Parmenides, 367 n. a
 Pebbles, used for calculating,
 35
 Pentagon, regular, 223 n. b
 Pentagram, Pythagorean
 figure, 225 and n. b
 "Perfect" numbers, 71, 75-87
 Perseus : life, ii. 365 n. a ;
 discovered spiric curves, ii.
 363-365
Phenomena of Eudoxus and
 Aratus, ii. 407 n. a ; for
 Euclid's *Phenomena*, v.
 Euclid : Works
 Philippus of Opus (or Med-
 ma), 155 and n. a
 Philolaus, ii. 3 n. a
 Philon of Byzantium : solu-
 tion of problem of two
 mean proportionals, 263
 n. a, 267 n. b ; cube root,
 63 n. a
 Philoponus, Joannes, on
 quadrature of lunes, 311
 n. b
Planisphaerium : v. Ptolemy
 Plato : his inscription over
 the doors of the Academy,
 387 and n. b ; his belief
 that "God is for ever play-
 ing the geometer," 387 ;
 his dislike of mechanical
 constructions, 263 n. b,
 389 ; his identification of
 the Good with the One,
 340 ; his philosophy of
 mathematics, 381-385 ; the
 problem in the *Meno*, 395-
 397 ; the Nuptial Number
 in the *Republic*, 399 ; on
 the generation of numbers.
 401-405 ; his reported
 solution of the problem of

INDEX

- two mean proportionals, 263-267; his application of analysis to theorems about "the section," 153 and n. a; his knowledge of side- and diameter-numbers, 137 n. a, 399 n. c; his formula for the sides of right-angled triangles, 93-95, his definition of a point, ii. 469 n. a; his use of the term mathematics, 3 n. c, 401 n. a; his curriculum for the Guardians in the *Republic*, 7-17; Proclus's notice, 151; taught by Theodorus, 151 n. b; his pupils—Eudoxus, 151, Amyclas of Heraclea, 153, Menaechnus, 153, Philippus, 155; Euclid said to have been a Platonist, 157 and n. b; modern works on Plato's mathematics, 387 n. a, 397 n. a, 399 n. a, 405 n. b
- "Platonic" figures: v. Regular Solids
- "Playfair's Axiom," ii. 371 n. c
- Plutarch: on parallel section of a cone, 229 and n. a; on Plato's mathematics, 263 n. b, 387-389
- Point, 437, ii. 469 and n. a
- Polygonal numbers, 95-99, ii. 396 n. a, ii. 515, ii. 561
- Pontus, paradoxical eclipses near, ii. 401
- Porism, 479-481
- Porisms*: v. Euclid: Works, and Diophantus of Alexandria
- Posidonius: life and works, ii. 371 n. b; on the size of the earth, his definition of parallels, ii. 371-373
- Postulates: v. Axioms and postulates
- Prime numbers: v. Number
- Problems: plane, solid, linear, 349; distinction between problems and theorems, ii. 567
- Proclus: life, 125 n. a; his *Commentary on Euclid* i., 145 n. a; summary of history of geometry, 145-161; his *Commentary on Plato's Republic*, 399 n. a; his criticism of the parallel-postulate, ii. 367-371; his attempt to prove the parallel-postulate, ii. 383-385
- Proof: Aristotle on rigour of geometrical proof, ii. 369; Archimedes on mechanical and geometrical proofs, ii. 221-223, ii. 229
- Proportion: Pythagorean theory of proportion and means, 111-125, 140; Eudoxus's new treatment applicable to all magnitudes, 409 and 447 n. a; Euclid's treatment, 445-451; v. also Means
- Psammites*: v. Archimedes: Works: *Sand-reckoner*
- Psellus, Michael, 3 n. a, ii. 515 and n. c, ii. 517 n. a
- Pseudaria*: v. Euclid: Works
- Pseudo-Platosthenes, letter to Ptolemy Euergetes, 257-261

Ptolemies: Euergetes I, 257 and n. a, ii. 261 and n. c; Philopator, 257 n. a, 297; Epiphanes, ii. 261 and n. d
 Ptolemy, Claudius: life and works, ii. 409 and n. b; his work *On Balancing*, ii. 411; his *Optics*, ii. 411 and n. a, ii. 503 n. a; his book *On Dimension*, ii. 411-413; his *Syntaxis* (*Treat Collection, Almagest*), ii. 409 and n. b; commentaries by Pappus and Theon, 48 and n. a, ii. 409 n. b, ii. 565-567, ii. 621 n. a; his construction of a table of sines, ii. 413-445; his *Planisphaerium*, ii. 565 n. a; his *Analemma*, 301 n. b, ii. 409 n. b; his value for $\sqrt{3}$, 61 n. b; on the parallel-postulate, ii. 373-383
 Pyramid: v. Tetrahedron
 Pythagoras: life, 149 n. b, 173; called geometry *inquiry*, 21; transformed study of mathematics into liberal education, 149; discovered theory of proportionals (possibly irrationals), 149; discovered musical intervals, 175; sacrificed an ox on making a discovery, 169 n. a, 175, 177, 185; "Pythagoras's Theorem," 179-185; extension by Pappus, ii. 575-579
 Pythagorean: of name mathematics, 3; esoteric

members called *mathematicians*, 3 n. d; Archytas a Pythagorean, 5; Pythagorean quadrivium, 5 and n. b, 7 n. a; stereometrical investigations, 7 n. a; declared harmony and astronomy to be sister sciences, 17 and n. b; how geometry was divulged, 21; views on monad and undetermined dyad, 173; their motto, 175-177
 Pythagorean arithmetic: first principles, 67-71; classification of numbers, 73-75; perfect numbers, 75-83; figured numbers, 87-99; some properties of numbers, 101-109; irrationality of $\sqrt{2}$, 111 n. a; ancient Pythagoreans recognized three means, 111-115; later Pythagorean list of means, 115-125; Archytas's proof that a superparticular ratio cannot be divided into equal parts, 131-133; developed theory of side and diameter-numbers, 137-139; the "bloom" of Thymaridas, 139-141
 Pythagorean geometry: definition of point, ii. 469; sum of angles of a triangle, 177-179; "Pythagoras's Theorem," 179-185; application of areas, 187-215; the irra-

INDEX

- tional, 215-217; the five regular solids, 217, 219 n. a, 223-224; Archytas's solution of the problem of two mean proportionals, 285-289; squaring of the circle, 335
- Otherwise mentioned: 245 n. a, 403 nn. c and d
- Quadratic equations: v. Algebra: Quadratic equations
- Quadratrix: discovered by Hippias, 149 n. a, 337 n. a; used to square the circle, 337-347
- Quadrivium, Pythagorean, 5 and n. b, 7 n. a
- Quinary system of numerals, 31 n. a
- Reduction of a problem: Proclus's definition, 253; Hippocrates' reduction of problem of doubling the cube, 253 and n. a
- Reflection, equality of angles of incidence and reflection, ii. 497-503
- Regular solids ("Platonic" or "cosmic" figures): definition and origin, 217 n. a; Pythagorean treatment, 217-225; Speusippus's treatment, 77; work of Theaetetus, 379 and n. a; Plato's use in *Timaeus*, 219-223; Euclid's treatment, 157 and n. b, 467-479; Pappus's treatment, ii. 573-575 (esp. n. a); Eva Sachs' work, 217 n. a, 379 n. c
- Rhabdas, Nicolas Artavadas, 31 n. b; his finger-notation, 31-35
- Right-angled triangle: square on hypotenuse equal to sum of squares on other two sides, 179-185; extension by Pappus, ii. 575-579
- Roberts, Colin, 45 n. a
- Robertson, D. S., ii. 479 n. a
- Rome, A., ii. 565 n. a
- Ross, W. D., 95 n. b, 367 n. a, 371 n. b
- Rudio, F., 237 n. b
- Saccheri, *Euclides ab omni naero vindicatus*, 443 n. c
- Sachs, Eva, *Die fünf Platonischen Körper*, 217 n. a, 379 n. c; *De Theaeteto Atheniensi*, 379 n. a
- Salaminian table, 35 n. b, 37 n. a
- Sampi: use as numeral, 43
- Schiaparelli, G., 411 n. b, 415 n. c
- Schöne, H.: discovered Heron's *Metrica*, ii. 467 n. a
- Schöne, R.: edited Heron's *Metrica*, ii. 467 n. a
- Scopinas of Syracuse, ii. 3 n. a
- Sectio canonis*: v. Euclid: Works
- Semi-circle: angle in semi-circle a right angle, 167-169
- Serenus: commentary on

- Apollonius's *Conics*, ii. 285
n. a
- Sexagesimal system of numerals, 48-49
- "Side-" and "diameter-numbers," 133-139, esp. 137 n. a, 399 n. c
- Simon, M., *Euclid und die sechs planimetrischen Bücher*, 447 n. a
- Simplicius: on Hippocrates' quadratures, 235-253, 310 n. b, 313 n. a; on Ptolemy, ii. 409 n. b; on oblong and square numbers, 95 n. b; on planets, 411 and n. b
- Simson, R., ii. 345 n. c
- Sines, Table of: v. Chords, Table of
- "Solid" loci and problems, 349, 487, ii. 601
- "Solid" numbers: v. Number: Figured numbers
- Solids, five regular solids: v. Regular solids
- Solon, 37
- Sophocles, ix, 259 n. a
- Speusippus, 75-77, 81 n. a
- Sphaeric (geometry of sphere), 5 and n. b, 407 n. a
- Sphaerica*: work by Theodorus, ii. 407 n. a; by Menelaus, ii. 407 n. a, ii. 462 n. a
- Spiral: of Archimedes, ii. 183-195, on a sphere, ii. 581-587
- Spiric sections: v. Tore
- Sporus, on the quadratrix, 339-341
- Square numbers: divisibility of squares, 103-105; sums of squares, ii. 551-559
- Square root, extraction of, 53-61
- Squaring of the circle: v. Circle
- Stadium of Zeno*, 371-375
- Star-pentagon: v. Pentagon
- Stenzel, Julius: his *Zahl und Gestalt bei Platon und Aristoteles*, 405 n. b
- Stigmia: use as numeral, 43
- Subcontrary mean, 113-117, 117-119, 123
- Subcontrary section of cone, ii. 301 n. a
- Surface Loci*: v. Euclid: Works
- Synthesis, Pappus's discussion, ii. 597-599
- Table of Chords: v. Chords, Table of
- Tannery, P., 77 n. b, 237 n. b, 261 n. b, 335 n. d, 493 n. b, ii. 513 n. a, ii. 517 n. a and c, ii. 523 n. b, ii. 537 n. b
- Taylor, A. E., 23 n. b, 27 n. b, 115 n. b, 223 n. c, 405 n. b, 427 n. b
- Tetrads, in Apollonius's system of enumeration, ii. 355 n. a
- Tetrahedron (pyramid), 83, 217 n. a, 221 n. c, 379
- Thales: life, 147 n. a; Proclus's notice, 147; discovered that circle is bisected by its diameter, 165 and n. a; that the angles

- at the base of an isosceles triangle are equal, 165; that the vertical and opposite angles are equal, 167; that the angle in a semicircle is a right angle, 167-169; his method of finding distance of ships at sea, 167 and n. b
- Theaetetus: life, 379 and n. a; Proclus's notice, 151; Suidas's notice, 379; his work on the regular solids, 379 and n. c; on the irrational, 381-383
- Themistius: on quadrature of lunes, 310 n. b; on oblong and square numbers, 95 n. b
- Theodorus of Cyrene: life, 151 n. b, 381 n. b; Proclus's notice, 151; his proof of incommensurability of $\sqrt{3}$, $\sqrt{5}$... $\sqrt{17}$, 381 and n. c
- Theodosius: his *Sphaerica*, ii. 407 n. a
- Theodosius I, Emperor, ii. 565 and n. a
- Theon of Alexandria: flourished under Theodosius I, 48 n. a, ii. 565; father of Hypatia, 48; to be distinguished from Theon of Smyrna, ii. 401 n. a; his commentary on Ptolemy's *Syntaxis*, 48, ii. 409 n. b, ii. 565-567, ii. 621 n. a
- Theon of Smyrna: referred to as "Theon the mathematician" by Ptolemy, ii. 401; made observations under Hadrian, ii. 401 and n. a; referred to as "the old Theon" by Theon of Alexandria, ii. 401 n. a
- Theophrastus, 217 n. c
- Theorems, distinction from problems, ii. 567
- Theudius of Magnesia, 153
- Thymaridas: an early Pythagorean, 130 n. b; his "bloom," 139-141; on prime numbers, 87 n. a
- Timaeus of Locri, 219 n. a
- Tore (also spire, or anchoring): defined, ii. 365, ii. 469; used by Archytas for the doubling of the cube, 285-289; sections of (Perseus), ii. 363-365; volume of (Dionysodorus and Heron), ii. 477-483
- Treasury of Analysis*: v. Pappus: Works
- Triangle: angles at base of an isosceles triangle equal, 165 and n. b; equality of triangles, 167 and n. b; sum of angles equal to two right angles, 177-179, ii. 279; "Pythagoras's Theorem," 179-185; extensionⁿ by Pappus, ii. 575-579; Heron's formula $\sqrt{s(s-a)(s-b)(s-c)}$ for area, ii. 471-477, ii. 603 n. a
- Triangular numbers, 91-95
- Trigonometry: origins in *sphaerica*, ii. 407 n. a; developed by Hipparchus and Menelaus, ii. 407 and n. a; their tables of sines, ii. 407 n. a, ii. 409 and n. a;

- Ptolemy's terminology, ii. 421 n. a; his construction of a table of sines, ii. 413-445; value of $\sin 18^\circ$ and $\sin 36^\circ$, ii. 415-419, ii. 421 n. a; of $\sin 60^\circ$, $\sin 90^\circ$, $\sin 120^\circ$, ii. 419-421 (incl. n. a); proof of $\sin^2 \theta + \cos^2 \theta = 1$, ii. 421-423; of "Ptolemy's Theorem," ii. 423-425; of $\sin(\theta + \phi) = \sin \theta \cos \phi + \cos \theta \sin \phi$, ii. 425-427; of $\sin^2 \frac{1}{2}\theta = \frac{1}{2}(1 - \cos \theta)$, ii. 429-431; of $\cos(\theta + \phi) = \cos \theta \cos \phi - \sin \theta \sin \phi$, ii. 431-435; a method of interpolation, ii. 435-443; the table of sines, ii. 443-445; "Menelaus's Theorem" and lemmas, ii. 447-463; proof that $\tan \alpha : \tan \beta < \alpha : \beta$, 503-505 (incl. n. a), ii. 11 n. b, ii. 389 and n. b; proof that $\sin \alpha : \sin \beta < \alpha : \beta$, ii. 439 n. a
- Trisection of an angle: a "solid" problem, 353; solution by means of a verging, 353-357; direct solution by means of conics, 357-363; Pappus's collection of solutions, ii. 581 n. b
- Unit, 67, 73, 89-91, ii. 469, ii. 515
- Usener, 237 n. b
- Valckenaer, 259 n. a
- Ver Eecke, Paul, ii. 19 n. a, ii. 285 n. a, ii. 513 n. a
- Vergings: Definition, 244 n. a; use by Hippocrates of Chios, 245; by Pappus, 355-357; by Archimedes, ii. 189 and n. c; Apollonius's treatise, ii. 345-347, ii. 337
- Vieta's expression for $2/\pi$, 315 n. a
- Vitruvius, ii. 3 n. a, ii. 251 n. a
- Viviani's curve of double curvature, 349 n. c
- Wescher, C., his *Poliorcétique des Grecs*, 267 n. b
- Wilamowitz - Moellendorf, U. v., 257 n. a
- William of Moerbeke; his trans. of Archimedes' *On Floating Bodies*, ii. 242 n. a, ii. 245 n. b; *De Speculis*, ii. 503 n. a
- Xenocrates, 75, 425 n. b
- Zeno of Elea: life, 367 n. a; a disciple of Parmenides, ii. 367 n. a; four arguments on motion, 367-375
- Zenodorus, ii. 387 n. b; on isoperimetric figures, ii. 387-397
- Zero, 47 and n. a
- Zeuthen; *Die Lehre von den Kegelschnitten im Altertum*, 493 n. b, ii. 265 n. a, ii. 281 n. a; *Geschichte der Mathematik*, 245 n. a; otherwise mentioned, 381 n. a, 505 n. a
- Zodiac circle: division into 360 parts, ii. 395-397; signs of Zodiac, 223 n. c

LIST OF ANCIENT TEXTS CITED

INDEX OF GREEK TERMS

The purpose of this index is to give one or more typical examples of the use of Greek mathematical terms occurring in these volumes. Non-mathematical words, and the non-mathematical uses of words, are ignored, except occasionally where they show derivation. Greek mathematical terminology may be further studied in the Index Graecitatis at the end of the third volume of Hultsch's edition of Pappus and in Heath's notes and essays in his editions of Euclid, References to vol. i. are by page alone, to A few common abbreviations are used. For their principal part, but a few cross-References are obvious.

*Λεω, to draw; εὐθεῖαν γραμμήν ἀγαγεῖν, to draw a straight line, 142 (Eucl.); εἰς ἐπιφανέουσιν ἀχθῶσιν, if tangents be drawn, ii. 64 (Archim.); παράλληλος ἤχθω ἡ ΑΚ, let ΑΚ be drawn parallcl, ii. 312 (Apollon.)

ἀγνομήτης, ον, ignorant of or unversed in geometry, 386 (Ptolemy)

ἀδιαίρετος, ον, undivided, indivisible, 366 (Aristot.)

ἀδύνατος, ον, impossible, 394 (Plat.), ii. 566 (Papp.); ὅπερ ἐστὶν ἀ., often without ἐστίν, which is impossible, a favourite conclusion to reasoning based on false premises, ii. 122 (Archim.); οἱ διὰ τοῦ ἀ. περαινόντες,

those who argue per impossibile, 110 (Aristot.)

ἄθροισμα, ατος, τό, collection; ἀ. φιλοτεχνότατον, a collection most skilfully framed, 480 (Papp.)

Αἰγυπτιακός, ἡ, ὡς, Egyptian; αἱ Αἰ. καλούμεναι μέθοδοι ἐν πολλαπλασιασμοῖς, 16 (Schol. in Plat. Charm.)

αἶρω, to take away, subtract, ii. 506 (Heron)

αἰτεῖν, to postulate, 442 (Eucl.), ii. 206 (Archim.)

αἵτημα, ατος, τό, postulate, 420 (Aristot.), 440 (Eucl.), ii. 366 (Procl.)

ἀκίνητος, ον, that cannot be moved, immobile, fixed, 394 (Aristot.), ii. 246 (Archim.)

ἀκολουθεῖν, to follow, ii. 414 (Ptol.)

INDEX OF GREEK TERMS

- ἀκόλουθος, *ον*, following, consecutive, corresponding, ii. 580 (Papp.); as subst., ἀκόλουθον, τό, consequence, ii. 566 (Papp.)
- ἀκολουθῶς, *adv.*, consistently, consequently, in turn, 458 (Eucl.), ii. 384 (Procl.)
- ἀκουσματικός, ἡ, *όν*, eager to hear; as subst., ἄ., δ., hearer, exoteric member of Pythagorean school, 3 n. d (Iambl.)
- ἀκριβής, *ές*, exact, accurate, precise, ii. 414* (Ptol.)
- ἄκρος, *α*, *ον*, at the farthest end, extreme, ii. 270 (Cleom.); of extreme terms in a proportion, 122 (Nicom.); ἄ. καὶ μέσος λόγος, extreme and mean ratio, 472 (Eucl.), ii. 416 (Ptol.)
- ἄλλως, alternatively, 356 (Papp.)
- ἄλογος, *ον*, irrational, 420 (Aristot.), 452 (Eucl.), 456 (Eucl.); δι' ἀλόγου, by irrational means, 388 (Plut.)
- ἀμβλυγώνιος, *ον*, obtuse-angled; ἄ. τρίγωνον, 440 (Eucl.); ἄ. κώνος, ii. 278 (Eutoc.)
- ἀμβλὺς, εἶα, ὅ, obtuse; ἄ. γωνία, often without γωνία, obtuse angle, 438 (Eucl.)
- ἀμετάθετος, *ον*, unaltered, immutable; μονάδος ἄ. οὐσης, ii. 514 (Dioph.)
- ἀμήχανος, *ον*, impracticable, 298 (Eutoc.)
- ἄμφοισμα, *ατος*, τό, revolving figure, ii. 604 (Papp.)
- ἄμφοιστικός, ἡ, *όν*, described by revolution; ἄμφοιστικόν, τό, figure generated by revolution, ii. 604 (Papp.)
- ἀναγράφειν, to describe, construct, 180 (Eucl.), ii. 68 (Archim.)
- ἀνακλᾶν, to bend back, incline, reflect (of light), ii. 496 (Damian.)
- ἀνάλημμα, *ατος*, τό, a representation of the sphere of the heavens on a plane, analemma; title of work by Diodorus, 300 (Papp.)
- ἀναλογία, ἡ, proportion, 446 (Eucl.); κυρίως ἄ. καὶ πρώτη, proportion par excellence and primary, i.e., the geometric proportion, 125 n. a; συνεχῆς ἄ., continued proportion, 262 (Eutoc.)
- ἀνάλογον, *adv.*, proportionally, but nearly always used adjectivally, 70 (Eucl.), 446 (Eucl.)
- ἀναλύειν, to solve by analysis, ii. 160 (Archim.); ὁ ἀναλύμενος τόπος, the Treasury of Analysis, often without τόπος, e.g., ὁ καλούμενος ἀναλύμενος, ii. 506 (Papp.)
- ἀνάλυσις, *εως*, ἡ, solution of a problem by analytical method, analysis, ii. 506 (Papp.)
- ἀναλυτικός, ἡ, *όν*, analytical, 158 (Procl.)

INDEX OF GREEK TERMS

ἀναμέτρῃσις, εὖς, ἡ, *measurement*; Περὶ τῆς ἀ. τῆς γῆς, title of work by Eratosthenes, ii. 272 (Heron)

ἀνάπαλιν, adv., *in a reverse direction*; transformation of a ratio known as *invertendo*, 448 (Eucl.)

ἀναποδεικτικῶς, adv., *independently of proof*, ii. 370 (Procl.)

ἀνιστρέφειν, *to convert a ratio according to the rule of Eucl. v. Def. 16*; ἀνιστρέφοντι, *lit. to one who has converted, convertendo*, 466 (Eucl.)

ἀναστροφή, ἡ, *conversion of a ratio according to the rule of Eucl. v. Def. 16*, 448 (Eucl.)

ἀνεπαίσθητος, ον, *unperceived, imperceptible*; hence, *negligible*, ii. 482 (Heron)

ἀνισος, ον, *unequal*, 444 (Eucl.), ii. 50 (Archim.)

ἀνιστάται, *to set up, erect*, ii. 78 (Archim.)

ἀντακολουθία, ἡ, *reciprocity*, 76 (Theol. Arith.)

ἀντικείμενα, *to be opposite*, 114 (Nicom.); τοιαῦτα ἀντικείμενα, *opposite branches of a hyperbola*, ii. 322 (Apollon.)

ἀντιπάσχειν, *to be reciprocally proportional*, 114 (Nicom.); ἀντιπεριουθότως, adv., *reciprocally*, ii. 208 (Archim.)

ἀντιστροφή, ἡ, *conversion*,

converse, ii. 140 (Archim. ap. Eutoc.)

ἀξίωμα, ατος, τό, *axiom, postulate*, ii. 42 (Archim.)

ἄξων, ονος, ὁ, *axis*; of a cone, ii. 286 (Apollon.); of any plane curve, ii. 288 (Apollon.); of a conic section, 282 (Eutoc.); συζυγεῖς ἀ., *conjugate axes*, ii. 288 (Apollon.)

ἀόριστος, ον, *without boundaries, undefined*, πλήθος μονάδων ἀ., ii. 522 (Dioph.)

ἀπαγωγή, ἡ, *reduction of one problem or theorem to another*, 252 (Procl.)

ἀπαρτίζειν, *to make even*; οἱ ἀπαρτίζοντες ἀριθμοί, *factors*, ii. 506 (Heron)

ἀπειραχῶς, *in an infinite number of ways*, ii. 572 (Papp.)

ἄπειρος, ον, *infinite*; as subst., ἀπειρος ἀριθμός, *finite*, 124 (Archim.); ἀπὸ ἀπειρον. ἀριθμῶν, *indefinitely*, 440 (Eucl.); ἐπ' ἀ., ii. 580 (Papp.)

ἀπεναντίον, adv. used adjectively, *opposite*; αἱ ἀ. πλευραί, 444 (Eucl.)

ἀπέχειν, *to be distant*, 470 (Eucl.), ii. 6 (Aristarch.)

ἀπλανής, ἐς, *motionless, fixed*, ii. 2 (Archim.)

ἀπλατής, ἐς, *without breadth*, 436 (Eucl.)

ἀπλός, η, ον, *simple*; ἀπλοῦς, ἡ, οὖν, *simple*; ἀ. γραμμῇ, ii. 360 (Procl.)

INDEX OF GREEK TERMS

ἀπλῶς, *simply, absolutely*, 421 (Aristot.); *generally*, ii. 132 (Archim.)
 ἀπλῶσις, εὖσις, ἡ, *simplification, explanation*: Ἀ. ἐπιφανείας σφαίρας, *Explanation of the Surface of a Sphere*, title of work by Ptolemy, ii. 408 (Suidas)
 ἀπό, *from*; τὸ ἀπὸ τῆς διαμέτρου τετράγωνον, *the square on the diameter*, 332 (Archim.); τὸ ἀπὸ ΓΠ (sc. τετράγωνον), *the square on ΓΠ*, 268 (Eutoc.)
 ἀποδεικτικός, ἡ, ὄν, *affording proof, demonstrative*, 420 (Aristot.), 158 (Procl.)
 ἀποδεικτικῶς, *adv., theoretically*, 260 (Eutoc.)
 ἀπόδειξις, εὖσις, ἡ, *proof, demonstration*, ii. 42 (Archim.), ii. 566 (Papp.)
 ἀποκαθιστάναι, *to re-establish, restore*; *pass., to return to an original position*, ii. 182 (Archim.)
 ἀπολαμβάνειν, *to cut off*; ἡ ἀπολαμβανομένη περιφέρεια, 440 (Eucl.)
 ἀπορία, ἡ, *difficulty, perplexity*, 256 (Theon Smyr.)
 ἀπόστημα, ἀτος, τό, *distance, interval*, ii. 6 (Aristarch.)
 ἀποτομή, ἡ, *cutting off, section*; Λόγου ἀποτομή, Χωρίου ἀποτομή, *works by Apollonius*, ii. 598 (Papp.)
 ἀρρητός, ὁ, *compound irrational straight line equivalent to binomial surd*

with negative sign, *apotome*, 456 (Eucl.)
 ἄπτειν, *to fasten to*; *mid., ἄπτεσθαι, to be in contact, meet*, 438 (Eucl.), ii. 106 (Archim.)
 ἄρα, *therefore*, *used for the steps in a proof*, 180 (Eucl.)
 ἄρβηλος, ὁ, *semicircular knife used by leather-workers, a geometrical figure used by Archimedes and Pappus*, ii. 578 (Papp.)
 ἀριθμεῖν, *to number, reckon, enumerate*, ii. 198 (Archim.), 90 (Luc.)
 ἀριθμητικός, ἡ, ὄν, *of or for reckoning or numbers*; ἡ ἀριθμητική (sc. τέχνη), *arithmetic*, 6 (Plat.), 420 (Aristot.); ἡ ἀριθμητική μέση (sc. εὐθεία), *arithmetic mean*, ii. 568 (Papp.); ὁ μεσότης, 110 (Iambl.)
 ἀριθμητός, ἡ, ὄν, *that can be counted, numbered*, 16 (Plat.)
 ἀριθμός, ὁ, *number*, 6 (Plat.), 66 (Eucl.); *πρῶτος ἀ., prime number*, 68 (Eucl.); *πρῶτοι, δεύτεροι, τρίτοι, τέταρτοι, πέμπτοι ἀ., numbers of the first, second, third, fourth, fifth order*, ii. 198-199 (Archim.); *μηλίκης ἀ., problem about a number of sheep*, 16 (Schol. in Plat. Charm.); *φωλίκης ἀ., problem about a number of bowls* (ibid.)

INDEX OF GREEK TERMS

ἀριθμοστόν, τό, *fraction whose denominator is unknown* [$\frac{1}{x}$], ii. 522 (Dioph.)

ἀρμόζειν, *to fit together*, ii. 494 (Heron)

ἁρμονία, ἡ, *musical scale, octave, music, harmony*, 404 (Plat.); used to denote a square and a rectangle, 398 (Plat.)

ἁρμονικός, ἡ, ὄν, *skilled in music, musical*; ἡ ἁρμονική (sc. ἐπιστήμη), *mathematical theory of music, harmonic*; ἡ ἁρμονική μέση, *harmonic mean*, 112 (Iambl.)

ἄρτιος, adv., *an even number of times*; ἄ. ἄρτιος ἀριθμός, *even-times even number*, 66 (Eucl.)

ἄρτιόπλευρος, ὄν, *having an even number of sides*; πολύγωνον ἄ., ii. 88 (Archim.)

ἄρτιος, α, ὄν, *complete, perfect*; ἄ. ἀριθμός, *even number*, 66 (Eucl.)

ἀρχή, ἡ, *beginning or principle of a proof or science*, 418 (Aristot.); *beginning of the motion of a point describing a curve*; ἀρ. τῆς ἑλικος, *origin of the spiral*, ii. 182

ἀρχικός, ἡ, ὄν, *principal, fundamental*; ἄ. σύμπωμα, *principal property of a curve*, ii. 282 (Apollon.), 338 (Papp.)

ἀρχικώτατος, ὄν, *sovereign,*

fundamental; ἄ. ρίζα, 90 (Nicom.)

ἀρχιτεκτονική, ἡ, ὄν, *of or for architecture*; ἡ ἀρχιτεκτονική (sc. τέχνη), *architecture*, ii. 616 (Papp.)

ἀστρολογία, ἡ, *astronomy*, 388 (Aristox.)

ἀστρολόγος, ὁ, *astronomer*, 378 (Suidas)

ἀστρονομία, ἡ, *astronomy*, 14 (Plat.)

ἀσύμμετρος, ὄν, *incommensurable, irrational*, 110 (Aristot.), 452 (Eucl.), ii. 214 (Archim.)

ἀσύμπτωτος, ὄν, *not falling in, non-secant, asymptotic*, ii. 374 (Procl.); ἄ. (sc. γραμμή), ἡ, *asymptote*, ii. 282 (Apollon.)

ἀσύνθετος, ὄν, *incomposite*; ἄ. γραμμή, ii. 360 (Procl.)

ἄτακτος, ὄν, *unordered*; Περὶ ἄτ. ἀλόγων, *title of work by Apollonius*, ii. 350 (Procl.)

ἀτελής, ἐς, *incomplete*; ἄ. ἀμφοιστικά, *figures generated by an incomplete revolution*, ii. 604 (Papp.)

ἄτομος, ὄν, *indivisible*; ἄτομοι γραμμαί, 424 (Aristot.)

ἄτοπος, ὄν, *out of place, absurd*; ὅπερ ἄτοπον, *which is absurd*, a favourite conclusion to a piece of reasoning based on a false premise, e.g. ii. 114 (Archim.)

INDEX OF GREEK TERMS

αὐξάνειν, *to increase, to multiply*; τρις αὐξηθεῖς, 398 (Plat.)

αὐξη, ἡ, *increase, dimension*, 10 (Plat.)

αὐξησις, ἡ, *increase, multiplication*, 398 (Plat.)

αὐτόματος, η, ου, *self-acting*; Αὐτόματα, τά, *title of work by Heron*, ii. 616 (Papp.)

ἀφαιρεῖν, *to cut off, take away, subtract*, 444 (Eucl.)

ἀφή, ἡ, *point of concurrence of straight lines; point of contact of circles or of a straight line and a circle*, ii. 64 (Archim.)

Ἀχιλλεύς, ἑως, ὁ, *Achilles, the first of Zeno's four arguments on motion*, 368 (Aristot.)

Βάρος, ους, Ion. εος, τό, *weight, esp. in a lever*, ii. 206 (Archim.), or *system of pulleys*, ii. 490 (Heron); τὸ κέντρον τοῦ βάρους, *centre of gravity*, ii. 208 (Archim.)

βαρουλικός (sc. μηχανή), ἡ, *lifting-screw invented by Archimedes, title of work by Heron*, ii. 189 n. a

βάσις, εως, ἡ, *base; of a geometrical figure; of a triangle*, 318 (Archim.); *of a cube*, 322 (Plat.); *of a cylinder*, ii. 42 (Archim.); *of a cone*, ii. 304 (Apolon.); *of a segment of a sphere*, ii. 40 (Archim.)

Γεωδαισία, ἡ, *land dividing, mensuration, geodesy*, 18 (Anatolius)

γεωμετρεῖν, *to measure, to practise geometry*; ἀεὶ γ. τὸν θεόν, 386 (Plat.);

γεωμετρομένη ἐπιφάνεια, *geometric surface*, 292 (Eutoc.), γεωμετρομένη ἀπόδειξις, *geometric proof*, ii. 228 (Archim.)

γεωμέτρης, ου, ὁ, *land measurer, geometer*, 258 (Eutoc.)

γεωμετρία, ἡ, *land measurement, geometry*, 256 (Theon Smyr.), 144 (Procl.)

γεωμετρικός, ἡ, ὄν, *pertaining to geometry, geometrical*, ii. 590 (Papp.), 298 (Eutoc.)

γεωμετρικῶς, adv., *geometrically*, ii. 222 (Archim.)

γίνεσθαι, *to be brought about*; γεγόνετω, *let it be done, a formula used to open a piece of analysis; of curves, to be generated*, ii. 468 (Heron); *to be brought about by multiplication, i.e., the result (of the multiplication) is*, ii. 480 (Heron); τὸ γενόμενον, τὰ γενόμενα, *the product*, ii. 482 (Heron)

γλωσσόκομον, τό, *chest*, ii. 490 (Papp.)

γνομονικός, ἡ, ὄν, *of or concerning sun-dials*, ii. 616 (Papp.)

γνώμων, ονος, ὁ, *carpenter's*

INDEX OF GREEK TERMS

- square; pointer of a sundial*, ii. 268 (Cleom.); geometrical figure known as *gnomon*, number added to a figured number to get the next number, 98³ (Iamb.).
- γραμμή, ἡ, *line, curve*, 436 (Eucl.); εὐθεία γ. (often without γ.), *straight line*, 438 (Eucl.); ἐκ τῶν γραμμῶν, *rigorous proof by geometrical arguments*, ii. 412 (Ptol.)
- γραμμικός, ἡ, ὄν, *linear*, 348 (Papp.)
- γράφειν, *to describe*, 442 (Eucl.), ii. 582 (Papp.), 298 (Eutoc.); *to prove*, 380 (Plat.), 260 (Eutoc.)
- γραφή, ἡ, *description, account*, 260 (Eutoc.); *writing, treatise*, 260 (Eutoc.)
- γωνία, ἡ, *angle; επίπεδος γ., plane angle* (presumably including angles formed by curves), 438 (Eucl.); εὐθύγραμμος γ., *rectilinear angle* (formed by straight lines), 438 (Eucl.); ὀρθή, ἀμβλεία, ὀξεία γ., *right, obtuse, acute angle*, 440 (Eucl.)
- Δεικνύναι, *to prove; δέδευται γὰρ τοῦτο, for this has been proved*, ii. 220 (Archim.); δευτέρον ὅτι, *it is required to prove that*, ii. 168 (Archim.)
- δεῖν, *to be necessary, to be required; δεόν ἔστω, let it be required; ὅπερ ἔδει δεῖξαι, quod erat demonstrandum, which was to be proved*, the customary ending to a theorem, 184 (Eucl.); ὅπερ : ~ = ὅπερ ἔδει δεῖξαι, ii. 610 (Papp.)
- δεκάγωνον, τό, *a regular plane figure with ten angles*, 442 (Eucl.)
- δηλος, ἡ, ὄν, also ὅς, ὄν, *manifest, clear, obvious; ὅτι μὲν οὖν αὐτὰ συμπίπτει, δηλον, ii. 193* (Archim.)
- διάγειν, *to draw through*, 190 (Eucl.), 290 (Eutoc.)
- διάγραμμα, ατος, τό, *figure, diagram*, 428 (Aristot.)
- διαρπεῖν, *to divide, cut*, ii. 286 (Apollon.); διηρημένος, ὄν, *divided*; δ. ἀναλογία, *discrete proportion*, 262 (Eutoc.); διελόντι, lit. *to one having divided, dirimendo* (or, less correctly, *dividendo*), indicating the transformation of the ratio $a : b$ into $a - b : b$ according to Eucl. v. 15, ii. 130 (Archim.)
- διαίρεσις, εως, ἡ, *division, separation*, 368 (Aristot.); δ. λόγου, *transformation of a ratio dividendo*, 448 (Eucl.)
- διαμέρειν, *to remain, to remain stationary*, 258 (Eutoc.)
- διάμετρος, ὄν, *diagonal, diametrical*; as subst., δ. (sc. γραμμή), ἡ, *diagonal*; of a parallelogram, ii. 218

INDEX OF GREEK TERMS

- (Archim.); *diameter* of a circle, 438 (Eucl.); of a sphere, 466 (Eucl.); *principal axis* of a conic section in Archim., ii. 148 (Archim.); *diameter* of any plane curve in Apollon., ii. 286 (Apollon.); *πλαγία δ.*, transverse *diameter*, ii. 286 (Apollon.); *συζυγείς δ.*, conjugate *diameters*, ii. 288 (Apollon.)
- διάστασις, εως, ἡ, *dimension*, 412 (Simpl.)
- διαστέλλειν, *to separate*, ii. 502 (Heron)
- διάστημα, ατος, τό, *interval*; *radius* of a circle, ii. 192 (Archim.), 442 (Eucl.); *interval* or *distance* of a conchoid, 300 (Papp.); in a proportion, the *ratio* between terms, τὸ τῶν μειζόνων ὁρων δ., 112 (Archytas ap. Porph.); *dimension*, 88 (Nicom.)
- διαφορά, ἡ, *difference*, 114 (Nicom.)
- διδόναι, *to give*; aor. part., δοθείς, εἶσα, ἐν, *given*, ii. 598 (Papp.); Δεδομένα, τά, *Data*, title of work by Euclid, ii. 588 (Papp.); θέσει καὶ μεγέθει δεδοσθαι, *to be given* in position and magnitude, 478 (Eucl.)
- διελόντι, v. διαιρεῖν
- διαχῆς, ἐς, *discontinuous*; σπείρα πδ., *open spire*, ii. 364 (Procl.)
- διορίζειν, *to determine*, ii. 566 (Papp.); Διωρισμένη τομή, *Determinate Section*, title of work by Apollonius, ii. 598 (Papp.)
- διορισμός, ὁ, *statement of the limits of possibility* of a solution of a problem, diorismos, 150 (Procl.)
- διπλασιάζειν, *to double*, 258 (Eutoc.)
- διπλασιασμός, ὁ, *doubling*, *duplication*; κύβου δ., 258 (Eutoc.)
- διπλάσιος, α, ον, *double*, 302 (Papp.); δ. λόγος, *duplicate ratio*, 446 (Eucl.)
- διπλασίον, ον, later form for διπλάσιος, *double*, 326 (Archim.)
- διπλός, ἡ, ον, contr. διπλοῦς, ἡ, οὖν, *twofold*, *double*, 326 (Archim.); δ. ἰσότης, *double equation*, ii. 528 (Dioph.)
- δίχα, adv., *in two* (equal) *parts*, 66 (Eucl.); δ. τέμνειν, *to bisect*, 440 (Eucl.)
- διχοτομία, ἡ, *dividing in two*; *point of bisection*, ii. 216 (Archim.); Dichotomia, first of Zeno's arguments on motion, 368 (Aristot.)
- διχοτόμιος, ον, *cut in two*, *halved*, ii. 4 (Aristarch.)
- δύναμις, εως, ἡ, *power*, *force*, ii. 488 (Heron), ii. 616 (Papp.); αἱ πέντε δ., the five *mechanical powers* (wheel and axle, lever, pulley, wedge, screw), ii. 492 (Heron); *power* in

INDEX OF GREEK TERMS

- the algebraic sense, esp. square; δυνάμει, in power, i.e., squared, 322 (Archim.); δυνάμει σύμμετρος, commensurable in square, 450 (Eucl.); δυνάμει ἀσύμμετρος, incommensurable in square (*ibid.*)
- δυναμοδύναμις, *cws*, ἡ, fourth power of the unknown quantity [x^4], ii. 522 (Dioph.).
- δυναμοδυναμοστόν, τό, the fraction $\frac{1}{x^4}$ ii. 522 (Dioph.).
- δυναμοκύβος, ὁ, square multiplied by a cube, fifth power of the unknown quantity [x^5], ii. 522 (Dioph.).
- δυναμοκυβοστόν, τό, the fraction $\frac{1}{x^5}$ ii. 522 (Dioph.).
- δυναμοστόν, τό, the fraction $\frac{1}{x^2}$ ii. 522 (Dioph.).
- δύνασθαι, to be able, to be equivalent to; δύνασθαι τι, to be equivalent when squared to a number or area, ii. 96 (Archim.); ἡ δυναμένη (sc. ἐνθία), side of a square, 452 (Eucl.); αὐξήσεις δυνάμεναι, 398 (Plat.); παρ' ἣν δύνανται αἱ καταγόμεναι τεταγμένως ἐπὶ τὴν ΖΗ διάμετρον, the parameter of the ordinates to the diameter ΖΗ, ii. 308 (Apollon.).
- δυναστεύειν, to be powerful; pass., to be concerned with powers of numbers; αὐξήσεις δυναστευόμεναι, 398 (Plat.).
- δυνατός, ἡ, ὄν, possible, ii. 566 (Papp.).
- δυσοκαενειηκοντάεδρον, τό, solid with ninety-two faces, ii. 196 (Archim.).
- δυσοκαεξηκοντάεδρον, τό, solid with sixty-two faces, ii. 196 (Archim.).
- δυσοκατριακοντάεδρον, τό, solid with thirty-two faces, ii. 196 (Archim.).
- δωδεκάεδρος, ὄν, with twelve faces; as subst., δωδεκάεδρον, τό, body with twelve faces, dodecahedron, 472 (Eucl.), 216 (Aët.).
- ἑβδομηκοστόμονος, ὄν, seventy-first; τό, seventy-first part, 320 (Archim.).
- ἐγγράφειν, to inscribe, 470 (Eucl.), ii. 46 (Archim.).
- ἐγκύκλιος, ὄν, also α, ὄν, circular, ii. 618 (Papp.).
- εἶδος, οὗς, ἰόν, εὖς, τό, shape or form of a figured number, 94 (Aristot.); figure giving the property of a conic section, viz., the rectangle contained by the diameter and the parameter, ii. 317 n. α, 358 (Papp.), 282 (Eutoc.); term in an equation, ii. 524 (Dioph.); species—of number, ii. 522 (Dioph.), of angles 390 (Plat.).

INDEX OF GREEK TERMS

εἰκοσάεδρος, *ov*, having twenty faces; εἰκοσάεδρον, τό, body with twenty faces, *icosahedron*, 216 (Æcl.)

εἰκοσαπλάσιος, *ov*, twenty-fold, ii. 6 (Aristarch.)

ἐκατοντάς, ἀδος, ἡ, the number one hundred, ii. 198 (Archim.)

ἐκβάλλειν, to produce (a straight line), 442 (Eucl.), ii. 8 (Aristarch.), 352 (Papp.)

ἐκκαίεκοσάεδρον, τό, solid with twenty-six faces, ii. 196 (Archim.)

ἐκκεῖσθαι, used as pass. of ἐκτιθέναι, to be set out, be taken, ii. 96 (Archim.), 298 (Papp.)

ἐκκρούειν, to take away, eliminate, ii. 612 (Papp.)

ἐκπέτασμα, ατος, τό, that which is spread out, unfolded; Ἐκπετάσματα, title of work by Democritus dealing with projection of armillary sphere on a plane, 229 n. a

ἐκπρισμα, ατος, τό, section sawn out of a cylinder, *prismatic section*, ii. 470 (Heron)

ἐκτιθέναι, to set out, ii. 568 (Papp.)

ἐκτός, adv., without, outside; as prep., ἐ. τοῦ κύκλου, 314 (Alex. Aphr.); adv. used

adjectivally, ἡ ἐ. (sc. εὐθεία), *external straight line*, 314 (Simpl.); ἡ ἐ. γωνία τοῦ

τριγώνου, the *external*

angle of the triangle, ii. 310 (Apollon.)

ἐλάσσων, *ov*, smaller, less, 320 (Archim.); ἥτοι μείζων

ἐστὶν ἡ ἐ., ii. 112 (Archim.);

ἐ. ὀρθῆς, less than a right angle, 438 (Eucl.); ἡ ἐ. (sc. εὐθεία), minor in Euclid's classification of straight lines, 458 (Eucl.)

ἐλάχιστος, *η, ov*, smallest, least, ii. 44 (Archim.)

ἐλίζ, ἑλικος, ἡ, spiral, helix, ii. 182 (Archim.); spiral on a sphere, ii. 580 (Papp.)

ἐλλειμμα, ατος, τό, defect, deficiency, 206 (Eucl.)

ἐλλείπειν, to fall short, be deficient, 394 (Plat.), 188 (Procl.)

ἐλλειψις, εως, ἡ, falling short, deficiency, 186 (Procl.);

the conic section *ellipse*, so called because the square on the ordinate is equal to a rectangle whose height is equal to the abscissa applied to the parameter as base but falling short (ἐλλείπον), ii. 316 (Apollon.), 188 (Procl.)

ἐμβαδόν, τό, area, ii. 470 (Heron)

ἐμβάλλειν, to throw in, insert, ii. 511 (Papp.); multiply, ii. 534 (Dionoph.)

ἐμπίπτειν, to fall on, to meet, to cut, 342 (Eucl.), ii. 58 (Archim.)

ἐμπλέκειν, to plait or weave in; σπείρα ἐμπλεγμένη,

INDEX OF GREEK TERMS

interlaced spire, ii. 364 (Procl.)

ἐναλλάζειν, *adv.*, often used adjectivally, transformation of a ratio according to the rule of Eucl. v. Def. 12, *permutando*, 448 (Eucl.), ii. 144 (Archim.); ἐ. γωνίαι, *alternate angles*

ἐναντίος, *a, ov, opposite*; κατ' ἐ., ii. 216 (Archim.)

ἐναρμόζειν, *to fit in, to insert*, 284 (Eutoc.)

ἐπιτάσις, *εως, ἡ, inscription*, 396 (Plat.)

ἐντελής, *ἐς, perfect, complete*; τρίγωνον ἐ., 90 (Procl.)

ἐντός, *adv. used adjectivally, within, inside, interior*; αἱ ἐ. γωνίαι, 442 (Eucl.)

ἐνυπάρχειν, *to exist in*; εἶδη ἐνυπάρχοντα, *τά, positive terms*, ii. 524 (Dioph.)

ἐξαγωνικός, *ἡ, ὄν, hexagonal*; ἐ. ἀριθμός, 96 (Nicom.)

ἐξάγωνος, *ov, as subst. ἑξάγωνον, τό, hexagon*, 470 (Eucl.)

ἐξηκοστός, *ἡ, ὄν, sixtieth*; in astron., πρῶτον ἐξηκοστόν, *τό, first sixtieth, minute*, δεύτερον ἐ., *second sixtieth, second*, 50 (Theon Alex.)

ἐξῆς, *adv., in order, successively*, ii. 566 (Papp.)

ἐπαφή, *ἡ, touching, tangency, contact*, 314 (Simpl.);

Ἐπαφαί, *On Tangencies*, title of a book by Apollonius, ii. 336 (Papp.)

ἐπεσθαι, *to be or come after, follow*; τὸ ἐπόμενον, *con-*

sequence, ii. 566 (Papp.); τὰ ἐπόμενα, *rearward elements*, ii. 184 (Apollon.); in theory of proportion, τὰ ἐπόμενα, *following terms, consequents*, 438 (Eucl.)

ἐπί, *prep. with acc., upon, on to, on, εὐθεία ἐπ' εὐθείαν σταθεῖσα*, 438 (Eucl.)

ἐπιζευγνύναι, *to join up*, ii. 608 (Papp.); αἱ ἐπιζευγθεῖσαι εὐθείαι, *connecting lines*, 272 (Eutoc.)

ἐπίλογος, *ἡ, reckoning, calculation*, ii. 412 (Ptol.)

ἐπίπεδος, *ov, plane*; ἐ. ἐπιφάνεια, 438 (Eucl.); ἐ. γωνία, 438 (Eucl.); ἐ. σχῆμα, 438 (Eucl.); ἐ. ἀριθμός, 70 (Eucl.); ἐ. πρόβλημα, 348 (Papp.)

ἐπιπέδως, *adv., plane-wise*, 88 (Nicom.)

ἐπιπλατής, *ἐς, flat, broad*; σφαιροειδὲς ἐ., ii. 164 (Archim.)

ἐπιπταγμα, *ατος, τό, injunction; condition*, ii. 50 (Archim.), ii. 526 (Dioph.);

ποιεῖν τὸ ἐ., *to satisfy the condition; subdivision of a problem*, ii. 340 (Papp.)

ἐπίτριτος, *ov, containing an integer and one-third, in the ratio 4:3*, ii. 222 (Archim.)

ἐπιφάνεια, *ἡ, surface*, 438 (Eucl.); κωνική ἐ., *conical surface (double cone)*, ii. 286 (Apollon.)

INDEX OF GREEK TERMS

- ἐπιβαίνειν, *to touch*, ii. 190 (Archim.); ἡ ἐπιβαίνουσα (sc. εὐθεία), *tangent*, ii. 64 (Archim.)
- ἑτερομήκης, *es*, with unequal sides, *oblique*, 440 (Eucl.)
- εὐθύγραμμος, *ov*, *rectilinear*; εὐ. γωνία, 438 (Eucl.); εὐ. σχῆμα, 440 (Eucl.); as subst., εὐθύγραμμον, τό, *rectilineal figure*, 318 (Archim.)
- εὐθύς, εἰς, ὅ, *straight*; εὐ. γραμμή, *straight line*, 438 (Eucl.); εὐθεία (sc. γραμμή), ἡ, *straight line*, ii. 44 (Archim.); *chord* of a circle, ii. 412 (Ptol.); *distance* (first, second, etc.) in a spiral, ii. 182 (Archim.); κατ' εὐθείας, *along a straight line*, ii. 580 (Papp.)
- εὐπαραχώρητος, *ov*, *readily admissible, easily obvious*; εὐ. λήμματα, ii. 230 (Archim.)
- εὕρεσις, *εως*, ἡ, *discovery, solution*, ii. 518 (Dioph.), 260 (Eutoc.)
- εὕρημα, *ας*, τό, *discovery*, 380 (Schol. in Eucl.)
- εὕρισκεν, *to find, discover, solve*, ii. 526 (Dioph.), 340 (Papp.), 262 (Eutoc.); ὅπερ εἶδει εὕρειν, *which was to be found*, 282 (Eutoc.)
- εὐχερής, *es*, *easy to solve*, ii. 526 (Dioph.)
- ἐφάπτεσθαι, *to touch*, ii. 224 (Archim.); ἐφαπτομένη, ἡ (sc. εὐθεία), *tangent*, 322 (Archim.)
- ἐφαρμογή, ἡ, *coincidence of geometrical elements*, 340 (Papp.)
- ἐφαρμόζω, *to fit exactly, coincide with*, 444 (Eucl.), ii. 208 (Archim.), 298 (Papp.); pass. ἐφαρμόζεσθαι, *to be applied to*, ii. 208 (Archim.)
- ἐφεξῆς, *adv.*, *in order, one after the other, successively*, 312 (Them.); used adjectivally, as αἱ ἐ. γωνίαι, *the adjacent angles*, 483 (Eucl.)
- ἐπιστάναι, *to set up, erect*; perf., ἐφεισθῆναι, *intr.*, *stand*, and perf. part. ael., ἐφεισθηκώς, *via*, ὅς, *standing*, 438 (Eucl.)
- ἐφοδος, ἡ, *method*, ii. 596 (Papp.); title of work by Archimedes
- εἶχειν, *to have*; λόγον εἶ., *to have a proportion or ratio*, ii. 14 (Aristarch.); γένεσθαι εἶ., *to be generated (of a curve)*, 348 (Papp.)
- ἕως, *as far as, to*, ii. 290 (Apollon.)
- ζητεῖν, *to seek, investigate*, ii. 222 (Archim.); ζητούμενον, τό, *the thing sought*, 158 (Procl.), ii. 596 (Papp.)
- ζήτησις, *εως*, ἡ, *inquiry, investigation*, 152 (Procl.)
- ζύγιον, τό = ζυγόν, τό, ii. 234 (Archim.)

INDEX OF GREEK TERMS

ζυγόν, τό, *beam of a balance, balance*, ii. 234 (Archim.)

ζῳδιον, τό, *dira. of ζῳον, lit. small figure painted or carved; hence sign of the Zodiac; ὁ τῶν Ζ. κύκλος, Zodiac circle*, ii. 394 (Hypsicles)

ἵγαισθαι, to *lead*; ἡγούμενα, τά, *leading terms in a proportion*, 448 (Eucl.)

ἡμικύκλιος, ον, *semicircular*; as subst., ἡμικύκλιον, τό, *semicircle*, 440 (Eucl.), ii. 568 (Papp.)

ἡμικύλινδρος, ὁ, *half-cylinder*, 260 (Eutoc.); dim. ἡμικυλίνδριον, τό, 286 (Eutoc.)

ἡμιόλιος, α, ον, *containing one and a half, half as much or as large again, one-and-a-half times*, ii. 42 (Archim.)

ἡμιος, εια, υ, *half*, ii. 10 (Aristarch.); as subst., ἡμιον, τό, 320 (Archim.)

θέσις, εως, ἡ, *setting, position*, 268 (Eutoc.); θέσει δεδύσθαι, to be given in position, 478 (Eutoc.)

θεωρεῖν, to *look into, investigate*, ii. 222 (Archim.)

θεώρημα, ατος, τό, *theorem*, 228 (Archim.); ii. 566 (Papp.); ii. 366 (Procl.)

θεωρητικός, ἡ, ὄν, *able to perceive, contemplative, speculative, theoretical*; applied to species of analysis, ii. 598 (Papp.)

θεωρία, ἡ, *inquiry, theoretical investigation, theory*, ii. 222 (Archim.), ii. 568 (Papp.)

θυρεός, ὁ, *shield*, 490 (Eucl.); ἡ (sc. γραμμή) τοῦ θ., *ellipse*, ii. 360 (Procl.)

ἴσάκις, adv., *the same number of times, as many times*; τὰ ἰ. πολλαπλάσια, *equimultiples*, 446 (Eucl.)

ἰσοβαρής, ἐς, *equal in weight*, ii. 250 (Archim.)

ἰσογκος, ον, *equal in bulk, equal in volume*, ii. 250 (Archim.)

ἰσογώνιος, ον, *equiangular*, ii. 608 (Papp.)

ἰσομήκης, ἐς, *equal in length*, 398 (Plat.)

ἰσοπερίμετρος, ον, *of equal perimeter*, ii. 386 (Theon Alex.)

ἰσόπλευρος, ον, *having all its sides equal, equilateral*; ἰ. τρίγωνον, 440 (Eucl.), ἰ. τετράγωνον, 440 (Eucl.), ἰ. πολύγωνον, ii. 54 (Archim.)

ἰσοπληθής, ἐς, *equal in number*, 451 (Eucl.)

ἰσορροπεῖν, to be *equally balanced, be in equilibrium, balance*, ii. 206 (Archim.)

ἰσορροπικά, τά, *title of work on equilibrium by Archimedes*, ii. 226 (Archim.)

ἰσορροπος, ον, *in equilibrium*, ii. 226 (Archim.)

ἴσος, η, ον, *equal*, 268 (Eutoc.); ἐξ ἴσου, *evenly*,

INDEX OF GREEK TERMS

438 (Eucl.); δι' ἴσων, *ex aequali*, transformation of a ratio according to the rule of Eucl. v. Def. 17, 448 (Eucl.)

ἰσοσκελής, ἑς, *with equal legs, having two sides equal*, *isosceles*; ἰ. τρίγωνον, 440 (Eucl.); ἰ. κῶνος, ii. 58 (Archim.)

ἰσοτυχέως, *uniformly*, ii. 182 (Archim.)

ἰσότης, ἦτος, ἡ, *equality, equation*, ii. 526 (Dioph.)

ἰσθάναι, *to set up*; εὐθεῖα ἐπ' εὐθείαν στήθεῖσα, 438 (Eucl.)

ἰσῶσις, εἰς, ἡ, *making equal, equation*, ii. 526 (Dioph.)

Κάθετος, ον, *let down, perpendicular*; ἡ κ. (sc. γραμμή), *perpendicular*, 438 (Eucl.), ii. 580 (Papp.)

καθολικός, ἡ, ὄν, *general*; κ. μέθοδος, ii. 470 (Heron)

καθολικῶς, *generally*; καθολικώτερον, *more generally*, ii. 572 (Papp.)

καθόλου, ἄν., *on the whole, in general*; τὰ κ. καλούμενα θεωρήματα, 152 (Procl.)

καμπύλος, η, ον, *curved*; κ. γραμμαί, ii. 42 (Archim.); 260 (Eutoc.)

κανόνιον, τό, *table*, ii. 444 (Ptol.)

κανονικός, ἡ, ὄν, *of or belonging to a scale*; ἡ κανονική (sc. τέχνη), *the mathematical theory of music, theory of musical intervals*,

canonic, 18 (Anatolius); κ. ἑκθεσίς, *display in the form of a table*, ii. 412 (Ptol.)

κανὼν, ὄνος, ὁ, *straight rod, bar*, 308 (Aristoph.), 264 (Eutoc.); *rule, standard, table*, ii. 408 (Suidas)

κατάγειν, *to draw down or out*, ii. 600 (Papp.)

καταγραφὴ, ἡ, *construction*, 188 (Procl.); *drawing, figure*, ii. 158 (Eutoc.), ii. 444 (Ptol.), ii. 610 (Papp.)

καταλαμβάνειν, *to overtake*, 368 (Aristot.)

καταλείπειν, *to leave*, 454 (Eucl.), ii. 218 (Archim.), ii. 524 (Dioph.); τὰ καταλείπόμενα, *the remainders*, 444 (Eucl.)

καταμετρεῖν, *to measure, i.e., to be contained in an integral number of times*, 444 (Eucl.)

κατασκευάζειν, *to construct*, 264 (Eutoc.), ii. 566 (Papp.)

κατασκευή, ἡ, *construction*, ii. 500 (Heron)

καταστερισμός, ὁ, *placing among the stars*; Καταστερισμοί, οἱ, *little of work wrongly attributed to Eratosthenes*, ii. 262 (Suidas)

κατατομή, ἡ, *cutting, section*; Κ. κανόνος, *title of work by Cleonides*, 157 n. c

κατοπτρικός, ἡ, ὄν, *of or in a mirror*; Κατοπτρικά, τά, *title of work ascribed to Euclid*, 156 (Procl.)

INDEX OF GREEK TERMS

κάτοπτρον, τό, *mirror*, ii. 498 (Heron)

κείσθαι, *to lie*, ii. 268 (Cleom.); of points on a straight line, 438 (Eucl.); as pass. of τιθέναι, *to be placed or made*; of an angle, 326 (Archim.); ὁμοίως κ., *to be similarly situated*, ii. 208 (Archim.)

κεντροβαρικός, ἡ, ὄν, *of or pertaining to a centre of gravity*? κ. σημεῖα, ii. 604 (Papp.)

κέντρον, τό, *centre*; of a circle, 438 (Eucl.), ii. 8 (Aristarch.), ii. 572 (Papp.); of a semicircle, 440 (Eucl.); ἡ (sc. γραμμῇ) or εὐθεῖα) ἐκ τοῦ κ., *radius of a circle*, ii. 40 (Archim.); κ. τοῦ βάρους, *centre of gravity*, ii. 208 (Archim.)

κινεῖν, *to move*, 264 (Eutoc.)

κίνησις, εὖς, ἡ, *motion*, 264 (Eutoc.)

κισσοειδής, ἐς, Ἀττ. κισσοειδής, ἐς, *like ivy*; κ. γραμμῇ, *cissoïd*, 276 n. a

κλᾶν, *to bend, to inflect*, 420 (Aristot.), 358 (Papp.);

κλῶμεναι εὐθεῖαν *inclined straight lines*, ii. 496 (Damian.)

κλίνειν, *to make to lean*; pass., *to incline*, ii. 252 (Archim.)

κλίσις, εὖς, ἡ, *inclination*; τῶν γραμμῶν κ., 438 (Eucl.)

κογχοειδής, ἐς, *resembling a mussel*; κ. γραμμαί (often

without γ.), *conchoidal curves, conchoids*, 296 (Eutoc.)

κοῖλος, ἡ, ὄν, *concave*; ἐπὶ τὰ αὐτὰ κ., *concave in the same direction*, ii. 42 (Archim.), 338 (Papp.)

κοινός, ἡ, ὄν, *common*, 412 (Aristot.); κ. πλευρά, ii. 500 (Heron); κ. ἔννοιαι, 444 (Eucl.); κ. τομή, ii. 290 (Apollon.); τὸ κοινόν, *common element*, 306 (Papp.)

κορυφή, ἡ, *vertex*; of a cone, ii. 286 (Apollon.); of a plane-curve, ii. 286 (Apollon.); of a segment of a sphere, ii. 40 (Archim.)

κοχλίας, οὐ, ὁ, *snail with spiral shell*; hence *anything twisted spirally*; screw, ii. 496 (Heron); screw of Archimedes, ii. 34 (Diod. Sic.); Περὶ τοῦ κ., work by Apollonius, ii. 350 (Procl.)

κοχλιοειδής, ἐς, *of or pertaining to a shell fish*; ἡ κ. (sc. γραμμῇ), *cochloid*, 334 (Simpl.); also κοχλοειδής, ἐς, as ἡ κ. γραμμῇ, 302 (Papp.); probably anterior to ἡ κογχοειδής γραμμῇ with same meaning

κρίκος, ὁ, *ring*; τετράγωνοι κ., *prismatic sections of cylinders*, ii. 470 (Heron)*

κυβίζειν, *to make into a cube, cube, raise to the third power*, ii. 504 (Heron)

INDEX OF GREEK TERMS

κυβικός, ἡ, ὄν, of or for a cube, cubic, 292 (Plat.)
 κυβόκυβος, ὁ, cube multiplied by a cube, sixth power of the unknown quantity [x^6], ii. 522 (Dioph.)
 κυβοκυβιστόν, τό, the fraction $\frac{1}{x^6}$, ii. 522 (Dioph.)
 κύβος, ὁ, cube, 258 (Eutoc.); cubic number, ii. 518 (Dioph.); third power of unknown, ii. 522 (Dioph.)
 κυβιστόν, τό, the fraction $\frac{1}{x^3}$, ii. 522 (Dioph.)
 κυκλικός, ἡ, ὄν, circular, ii. 360 (Procl.)
 κύκλος, ὁ, circle, 392 (Plat.), 438 (Eucl.); μέγιστος κ., great circle (of a sphere), ii. 8 (Aristarch.), ii. 42 (Archim.)
 κυλινδρικός, ἡ, ὄν, cylindrical, 286 (Eutoc.)
 κύλινδρος, οὐ, ὁ, cylinder, ii. 42 (Archim.)
 κυρίως, adv., -in a special sense; κ. ἀναλογία, proportion par excellence, i.e., the geometric proportion, 125 n. a
 κωνικός, ἡ, ὄν, conical, conic; κ. ἐπιφάνεια, conical surface (double cone), ii. 286 (Apollon.)
 κωνοειδής, ἑς, conical; as subst. κωνοειδές, τό, conoid; ὀρθογώνιον κ., right-angled conoid, i.e., paraboloid of revolution, ii. 164; ἀμβλυγώνιον κ., obtuse-angled

conoid, i.e., hyperboloid of revolution, ii. 164
 κῶψς, οὐ, ὁ, cone, ii. 286 (Apollon.)
 κωνοτομῆν, to cut the cone, 226 (Eratost. ap. Eutoc.)
 λαμβάνειν, to take, ii. 112 (Archim.); εἰλήφθω τὰ κέντρα, let the centres be taken, ii. 388 (Theon Alex.); λ. τὰς μέσας, to take the mean, 294 (Eutoc.); to receive, postulate, ii. 44 (Archim.)
 λέγειν, to choose, ii. 166 (Archim.)
 λείπειν, to leave, ii. 62 (Archim.); λείποντα εἶδη, τά, negative terms, ii. 524 (Dioph.)
 λείψις, εὖς, ἡ, negative term, minus, ii. 524 (Dioph.)
 λήμμα, ατος, τό, auxiliary theorem assumed in proving the main theorem, lemma, ii. 608 (Papp.)
 λημμάτιον, τό, dim. of λήμμα, lemma
 λῆψις, εὖς, ἡ, taking hold, solution, 260 (Eutoc.)
 λογικός, ἡ, ὄν, endowed with reason, theoretical, ii. 614 (Papp.)
 λογιστικός, ἡ, ὄν, skilled or practised in reasoning or calculating; ἡ λογιστική (sc. τέχνη), the art of manipulating numbers, practical arithmetic, logistic, 17 (Schol. ad Plat. Charm.)

INDEX OF GREEK TERMS

λόγος, ὁ, *ratio*, 444 (Eucl.); *Λόγου ἀποτομή*, (*Cutting-off of a Ratio*, title of work by Apollonius, ii. 598 (Papp.); λ. *συνημμένος*, compound *ratio*, ii. 602 (Papp.); λ. *μοναχός*, singular *ratio*, ii. 606 (Papp.); ἄκρος καὶ μέσος λ., extreme and mean *ratio*, 472 (Eucl.), ii. 416 (Ptol.)

λοιπός, ὁ, ὄν, *remaining*, ii. 600 (Papp.); as subst., *λοιπόν, τό*, the *remainder*, ii. 506 (Papp.), 270 (Eutoc.)

λοξός, ὁ, ὄν, *oblique, inclined*; κατὰ λ. κύκλου, ii. 4 (Plut.)
λύσις, ἡ, *solution*, ii. 596 (Papp.)

Μαγγανάριος, ὁ, *mechanical engineer, maker of mechanical powers*, ii. 616 (Papp.)
μάγγανον, τό, *block of a pulley*, ii. 616 n. α (Heron)

μάθημα, τό, *study*, 8 (Plat.), 4 (Archylus); *μαθήματα, τά*, *mathematics*; τὰ δὲ καλούμενα ἰδίως μ., 2 (Anatolius); 148 (Procl.), ii. 42 (Archim.), ii. 566 (Papp.)

μαθηματικός, ὁ, ὄν, *mathematical*; *μαθηματικός, ὁ*, *mathematician*, ii. 2 (Abl.), ii. 61 (Papp.); ἡ *μαθηματική* (sc. ἐπιστήμη), *mathematics*, 4 (Archylus); τὰ μ., *mathematics*

μέγεθος, οὗς, Ion. εὖς, τό, *magnitude*, 444 (Eucl.), ii. 50 (Archim.), ii. 412 (Ptol.)

μέθοδος, ἡ, *following after, investigation, method*, 90 (Procl.)

μεῖζων, ὁν, *greater, more*, 318 (Archim.); ἥτοι μ. ἐστὶν ἢ ἐλάσσων, ii. 112 (Archim.); μ. ὀρθῆς, *greater than a right angle*, 438 (Eucl.); ἡ μ. (sc. εὐθεία), *major* in Euclid's classification of irrationals, 458 (Eucl.)

μένειν, *to remain, to remain stationary*, 98 (Nicom.), 286 (Eutoc.)

μερίζειν, *to divide*, τι παρὰ τι, 50 (Theon Alex.)

μερισμός, ὁ, *division*, 16 (Schol. in Plat. Charm.), ii. 414 (Ptol.)

μέρος, οὗς, Ion. εὖς, τό, *part*; of a number, 66 (Eucl.); of a rectangle, 144 (Eucl.), ii. 50 (Papp.); τὰ μέρη, *parts, directions*, ἐφ' ἑκάτερα τὰ μ., in both *directions*, 438 (Eucl.)

μεσημβρινός, ὁ, ὄν, *for μεσημερινός, of or for noon*; μ. (sc. κύκλος), ὁ, *meridian*, ii. 268 (Cleom.)

μέσος, ὁ, ὄν, *middle*; ἡ μέση (sc. εὐθεία), *mean* (ἀριθμητική, γεωμετρική, ἀρμονική), ii. 568 (Papp.); μέση τῶν ΔΚ, ΚΓ, *mean* between ΔΚ, ΚΓ, 272 (Eutoc.); ἄκρος καὶ μ. λόγος, *extreme and mean ratio*, 472 (Eucl.), ii. 416 (Ptol.); ἡ μέση (sc. εὐθεία), *medial* in Euclid's classi-

INDEX OF GREEK TERMS

fication of irrationals, 458 (Eucl.); ἐκ δύο μέσων πρώτη, *first bimedral*, ἐκ δύο μέσων δευτέρα, *second bimedral*, etc., *ibid.*

μεσότης, ἡτος, ἡ, *mean*, ii. 566 (Papp.); μ. ἀριθμητική, γεωμετρική, ἀρμονική (ὑπερναντία), 110-111 (Iambl.)

μετρῶν, *to measure, contain an integral number of times*, 68 (Eucl.), ii. 54 (Archim.)

μέτρον, τό, *measure, relation*, ii. 294 (Prob. Bor.); κοινὸν μ., *common measure*, ii. 210 (Archim.)

μέχρι, *as far as*, prep. with gen.; ἡ μέχρι τοῦ ἀξονος (sc. γραμμῆς), ii. 256 (Archim.)

μῆκος, Dor. μάκος, εος, τό, *length*, 436 (Eucl.); *distance of weight from fulcrum of a lever*, ii. 206 (Archim.)

μηνίσκος, ὁ, *crescent-shaped figure, lune*, 238 (Eudemus ap. Simplic.)

μηχανή, ἡ, *contrivance, machine, engine*, ii. 26 (Plut.)

μηχανικός, ἡ, ὄν, *of or for machines, mechanical*, ii. 616 (Papp.); ἡ μηχανική (with or without τέχνη), *mechanics*, ii. 614 (Papp.); as subst., μηχανικός, ὁ, *mechanician*, ii. 616 (Papp.), 196 (Damian.)

μηχανοποιός, ὁ, *maker of engines*, ii. 616 (Papp.)

μικρός, ὁ, ὄν, *small, little*; M. ἀστρονομούμενος (sc. τόπος), *little Astronomy*, ii. 409 n. 5

μικτός, ἡ, ὄν, *mixed*; μ. ε γραμμῆς, ii. 360 (Procl.); μ. ἐπιφάνεια, ii. 470 (Heron)

μοῖρα, ας, ἡ, *portion, part*; in astron., *degree*, 50 (Theon Alex.); μ. τοπική, χρονική, ii. 396 (Hypsiel.)

μονάς, ἄδος, ἡ, *unit, monad*, 66 (Eucl.)

μοναχός, ἡ, ὄν, *unique, singular*; μ. λόγος, ii. 606 (Papp.)

μόριον, τό, *part*, 6 (Plat.)

μουσικός, ἡ, ὄν, Dor. μωσικός, ὁ, ὄν, *musical*; ἡ μουσική (sc. τέχνη), *poetry sung to music, music*, 4 (Archytas)

μυριάς, ἄδος, ἡ, *the number ten thousand, myriad*, ii. 198 (Archim.); μ. ἀπλαῖ, διπλαῖ, κτλ., *a myriad raised to the first power, to the second power, and so on*, ii. 355 n. a

μύριοι, αι, α, *ten thousand, myriad*; μ. μυριάδες, *myriad myriads*, ii. 198 (Archim.)

Νεύων, *to be in the direction of*, ii. 6 (Aristarch.); *of a straight line, to verge, i.e., to be so drawn as to pass through a given point and make a given intercept*, 244 (Eudemus ap. Simplic.), 420 (Aristot.), ii. 188 (Archim.)

INDEX OF GREEK TERMS

νεθσις, εως, ἡ, *inclination, verging*, problem in which a straight line has to be drawn through a point so as to make a given intercept, 245 n. a; στερεὰ θ., *solid verging*, 350 (Papp.); Νεύσις, title of work by Apollonius, ii. 598 (Papp.)

*Οδός, ἡ, *method*, ii. 596 (Papp.) ~

οἰκείος, α, ον, *proper to a thing*; ὁ οἰ. κύκλος, ii. 270 (Cleom.)

ὀκτάγωνος, ον, *eight-cornered*; as subst., ὀκτάγωνον, τό, *regular plane figure with eight sides, octagon*, ii. 196 (Archim.)

ὀκτάεδρος, ον, *with eight faces*; as subst., ὀκτάεδρον, τό, *solid with eight faces*, ii. 196 (Archim.)

ὀκταπλάσιος, α, ον, *eightfold*, ii. 5-11 (Papp.)

ὀκτωκαιδεκαπλάσιος, ον, *eighteen-fold*, ii. 6 (Aristarch.)

ὀκτωκαιτριάκοντάεδρον, τό, *solid with thirty-eight faces*, ii. 196 (Archim.)

ὀλόκληρος, ον, *complete, entire*; as subst., ὀλόκληρον, τό, *integer*, ii. 534 (Dioph.)

ὅλος, η, ον, *whole*; τὰ ὅ., 444 (Eucl.)

ὀμαλός, ἡ, ὄν, *even, uniform*, ii. 618 (Papp.) ~

ὀμαλῶς, adv., *uniformly*, 338 (Papp.)

ὅμοιος, α, ον, *like, similar*; ὁ. τριγώνον, 288 (Eutoc.);

ὅμοιοι ἐπίπεδοι καὶ στερεοὶ ἀριθμοί, 70 (Eucl.)

ὁμοίως, adv., *similarly*, ii. 176 (Archim.); τὰ ὁ. τεταγμένα, *the corresponding terms*, ii. 166 (Archim.); ὁ. κεῖσθαι, *to be similarly situated*, ii. 208 (Archim.)

ὁμολογεῖν, *to agree with, admit*; παρσ., *to be allowed, admitted*; τὸ ὁμολογούμενον, *that which is admitted, premise*, ii. 596 (Papp.)

ὁμόλογος, ον, *corresponding*; -ῶ. μέγεθρα, ii. 166 (Archim.); ὁ. πλευραί, ii. 208 (Archim.)

ὁμοταγής, ἐς, *ranged in the same row or line, co-ordinate with, corresponding to, similar to*, ii. 586 (Papp.)

ὄνομα, ατος, τό, *name*; ἡ (sc. εὐθεῖα) ἐκ δύο ὀνομάτων, *binomial in Euclid's classification of irrationals*, 458 (Eucl.) ~

ὀξυγώνιος, ον, *acute-angled*; ὁ. κῶνος and ὁ. κώνου τομή, ii. 278 (Eutoc.)

ὀξύς, εἰα, ὅ, *acute*; ὁ. γωνία, *acute angle*, often with γωνία omitted, 438 (Eucl.)

ὀπτικός, ἡ, ὄν, *of or for sight*; ὀπτικά, τά, *theory of laws of sight*; as prop. name, title of work by Euclid, 156 (Procl.) ~

ὀργανικός, ἡ, ὄν, *serving as instruments*; ὁ. λήμης, *mechanical solution*, 260 (Eutoc.)

INDEX OF GREEK TERMS

- ὀργανικῶς, adv., *by means of instruments*, 292 (Eutoc.)
 ὄργανον, τό, *instrument*, 294 (Eutoc.); dim. ὀργανίον, 294 (Eutoc.)
 ὀρθίος, α, ὄν, *upright, erect*; ἡ ὀρθία (sc. τοῦ εἵδους πλευρά), *the erect side of the rectangle formed by the ordinate of a conic section applied to the parameter as base, latus rectum, an alternative name for the parameter*, ii. 316 (Apollon.), ii. 322 (Apollon.)
 ὀρθογώνιος, ὄν, *having all its angles right, right-angled, orthogonal*; ὁ τετράγωνον, 440 (Eucl.); ὁ παραλληλόγραμμον, 268 (Eutoc.)
 ὀρθός, ἡ, ὄν, *right*; ὁ γωνία, *right angle*, 438, 442 (Eucl.); ὁ κώνος, *right cone*, ii. 286 (Apollon.)
 ὀρίζειν, *to separate, delimit, bound, define*, 382 (Plat.); εὐθεία ὀρισμένη, *finite straight line*, 188 (Eucl.)
 ὄρος, ὁ, *boundary*, 438 (Eucl.); *term in a proportion*, 112 (Archytas ap. Porph.), 114 (Nicom.)
 οὖν, *therefore*, used of the steps in a geometrical proof, 326 (Eucl.)
 ὀρεῖσθαι, *to be borne, to float in a liquid*; Περὶ τῶν οὐνομένων, *On floating bodies*, title of work by Archimedes, ii. 616 (Papp.)
 Παρά, *beside*; παραβάλλειν π. to apply a figure to a straight line, 188 (Eucl.); τι π. τι παραβάλλειν, to divide by, ii. 482 (Heron)
 παραβάλλειν, *to throw beside*; π. παρά, *to apply a figure to a straight line*, 188 (Eucl.); hence, since to apply a rectangle *xy* to a straight line *x* is to divide *xy* by *x*, π. = διαιρεῖν, ii. 482 (Heron)
 παραβολή, ἡ, *juxtaposition; division* (v. παραβάλλειν), hence *quotient*, ii. 530 (Dioph.); *the area of an area on a straight line*, 186 (Eucl.); the conic section *parabola*, so called because the square on the ordinate is equal to a rectangle whose height is equal to the abscissa applied to the parameter as base, ii. 304 (Apollon.), 186 (Procl.), 280 (Eutoc.)
 παράδοξος, ὄν, *contrary to expectation, wonderful*; ἡ π. γραμμή, *the curve called paradoxical* by Menelaus, 348 (Papp.); τὰ π., *the paradoxes of Erycinus*, ii. 572 (Papp.)
 παρακείσθαι, *to be adjacent*, ii. 590 (Papp.), 282 (Eutoc.)
 παραλληλεπίπεδον, τό, *figure bounded by three pairs of parallel planes, parallel-epiped*, ii. 600 (Papp.)

INDEX OF GREEK TERMS

παράλληλόγραμμος, *ov*, bounded by parallel lines; as subst., παράλληλόγραμμον, τό, parallelogram, 188 (Eucl.)

παράλληλος, *ov*, beside or opposite, side by side, parallel, 270 (Eucl.); π. εὐθεῖαι, 440 (Eucl.)

παρὰμῆκης, *es*, Dor. παρὰμᾶκης, *es*, oblong; σφαιροειδὲς π., ii. 164 (Archim.)

παρὰπλήρωμα, *atos*, τό, interstice, ii. 590 (Papp.); complement of a parallelogram, 190 (Eucl.)

παρὰτείνειν, *to stretch out along*, produce, 10 (Plat.)

παρὰύξησις, *cws*, ἡ, increase, ii. 412 (Ptol.)

παρὰύπτιος, *ov*, hyper-supine; παρὰύπτιον, τό, a quadrilateral with a re-entrant angle, 482 (Papp.)

πᾶς, *pāsa*, πᾶν, all, the whole, every, any; π. σημεῖον, any point, 412 (Eucl.)

πεντάγωνος, *ov*, pentagonal; π. ἀριθμός, 96 (Nicom.); as subst., πεντάγωνον, τό, pentagon, 222 (Iamb.)

περαίνειν, *to bring to an end*; πεπερασμένος, *ov*, terminated, 280 (Eucl.); γραμμαὶ πεπερασμέναι, finite lines, ii. 42 (Archim.)

πέρας, *atos*, τό, end, extremity; of a line, 436 (Eucl.); of a plane, 438 (Eucl.)

περατοῦν, *to limit*, bound; εὐθεία περατουμένη, 438 (Eucl.)

περιγράφειν, *to circumscribe*, ii. 48 (Archim.)

περιέχειν, *to contain*, bound; τό περιεχόμενον ὑπό, the rectangle contained by, ii. 108 (Archim.); αἱ περιέχουσαι τὴν γωνίαν γραμμαί, 438 (Eucl.); τό περιεχόμενον σχῆμα, 440 (Eucl.)

περιλαμβάνειν, *to contain*, include, ii. 104 (Archim.)

περίμετρος, *ov*, very large, well-fitting; ἡ π. (sc. γραμμῇ) = περίμετρον, τό, perimeter, ii. 318 (Archim.), ii. 502 (Heron), ii. 386 (Theon Alex.)

περισσάκις, Att. περιττάκις, *adv.*, taken an odd number of times; π. ἀρτιος ἀριθμός, odd-times even number, 68 (Eucl.); π. περισσὸς ἀριθμός, odd-times odd number, 68 (Eucl.)

περισσός, Att. περιττός, ἡ, ὄν, superfluous; subtilis; ἀριθμός π., odd number, 66 (Eucl.)

περιτιθέναι, *to place or put around*, 94 (Aristot.)

περιφέρεια, ἡ, circumference or periphery of a circle, arc of a circle, 440 (Eucl.), ii. 412 (Ptol.)

περιφορά, ἡ, revolution, turn of a spiral, ii. 182 (Archim.)

πηλικότης, *ητος*, ἡ, magnitude, size, ii. 412 (Ptol.)

INDEX OF GREEK TERMS

- πίπτειν, *to fall*; of points, ii. 44 (Archim.); of a straight line, 286 (Eutoc.)
- πλάγιος, α, ον, *oblique*: π. διάμετρος, *transverse diameter* of a conic section, ii. 286 (Apollon.); π. πλευρά, *transverse side* of the rectangle formed by the ordinate of a conic section applied to the parameter as base, ii. 316 (Apollon.) and ii. 322 (Apollon.)
- πλάσσειν, *to form*; of numbers, ii. 528 (Dioph.)
- πλάτος, ος, Ion. τος, τό, *breadth*, 438 (Eucl.)
- πλατύνειν, *to widen, broaden*, 88 (Nicom.)
- πλευρά, ἄς, ἡ, *side*; of a triangle, 440 (Eucl.); of a parallelogram, ii. 216 (Archim.); of a square, hence, *square root*, ii. 530 (Dioph.); of a number, 70 (Eucl.); πλαγία π., *latus rectum* of a conic section, ii. 322 (Apollon.); π. καὶ διάμετρος, 132 (Theon Smyr.)
- πλήθος, ος, Ion. εος, τό, *number, multitude*, 66 (Eucl.)
- πνευματικός, ἡ, ὄν, *of wind or air*; Πνευματικά, τά, *title of work by Heron*, ii. 616 (Papp.)
- ποιεῖν, *to do, construct*, ii. 566 (Papp.); *to make*, π. τομήν, ii. 290 (Apollon.); *to be equal to, to equal*, ii. 526 (Dioph.)
- πολλαπλασιάζειν, *to multiply*, 70 (Eucl.)
- πολλαπλάσιος, α, ον, *many times as large, multiple*; of a number, 66 (Eucl.); of a magnitude, 444 (Eucl.); as subst., πολλαπλάσιον, τό, *multiple*; τὰ ἰσάκεις π., *equimultiples*, 446 (Eucl.)
- πολλαπλασίον, ον = πολλαπλάσιος, ii. 212 (Archim.)
- πόλος, ὁ, *pole*; of a sphere, ii. 580 (Papp.); of a conchoid, 300 (Papp.)
- πολύγωνος, ον, *having many angles, polygonal*; comp., πολυγωνότερος, ον, ii. 592 (Papp.); as subst., πολύγωνον, τό, *polygon*, ii. 48 (Archim.)
- πολύεδρος, ον, *having many bases*; as subst., πολύεδρον, τό, *polyhedron*, ii. 572 (Papp.)
- πολυπλασιασμός, ὁ, *multiplication*, 16 (Schol. in Plat. Charm.), ii. 414 (Apollon.)
- πολύπλευρος, ον, *many sided, multifaceted*, 440 (Eucl.)
- πορίζω, *to bring about, find* either by proof or by construction, ii. 598 (Papp.), 252 (Procl.)
- πόρισμα, ατος, τό, *corollary to a proposition*, 480 (Procl.), ii. 294 (Apollon.); kind of proposition intermediate between a theorem and a problem, *porism*, 480 (Procl.)

INDEX OF GREEK TERMS

- ποριστικός, ἡ, ὄν, *able to supply or find*; ποριστικὸν τοῦ προταθέντος, ii. 598 (Papp.)
- πραγματεία, ἡ, *theory, investigation*, 148 (Procl.), ii. 406 (Theon Alex.)
- πρίσμα, ατος, τό, *prism*, ii. 470 (Heron)
- πρόβλημα, ατος, τό, *problem*, 14 (Plat.), 254 (Eutoc.), ii. 566 (Papp.)
- προβληματικός, ἡ, ὄν, *of or for a problem*; applied to species of analysis, ii. 598 (Papp.)
- πρόδηλος, ον, *clear, manifest*, ii. 496 (Heron)
- προηγέσθαι, *to take the lead*; προηγούμενα, τά, *forward points, i.e. those lying on the same side of a radius vector of a spiral as the direction of its motion*, ii. 184 (Archim.)
- προκατασκευάζειν, *to construct beforehand*, 276 (Eutoc.)
- προμήκης, ες, *prolonged, oblong*, 398 (Plat.)
- πρός, Dor. ποτί, prep., *towards*; ὡς ἡ ΔΚ πρὸς ΚΕ, the ratio ΔΚ : ΚΕ, 272 (Eutoc.)
- προσπίπτειν, *to fall*, 300 (Eutoc.); αἱ προσπίπτουσαι εὐθεῖαι, 438 (Eucl.), ii. 594 (Papp.)
- προσθέναι, *to add*, 444 (Eucl.)
- πρότασις, εως, ἡ, *proposition, enunciation*, ii. 566 (Papp.)
- προτείνειν, *to propose, to enunciate a proposition*, ii. 566 (Papp.); τὸ προτεθέν, that which was proposed, *proposition*, ii. 220 (Archim.)
- πρώτιστος, η, ον, *also os, on, the very first*, 90 (Nicom.)
- πρώτος, η, ον, *first*; π. ἀριθμός, *prime number*, 68 (Eucl.); but π. ἀριθμοί, *numbers of the first order* in Archimedes, ii. 198 (Archim.); in astron., π. ἑξήκοστόν, *first sixtieth, minute*, 50 (Theon Alex.); in geom., π. εὐθεία, *first distance of a spiral*, ii. 182 (Archim.)
- πτῶσις, εως, ἡ, *case of a theorem or problem*, ii. 600 (Papp.)
- πυθμήν, ἐνος, ὁ, *base, basic number of a series, i.e., lowest number possessing a given property*, 398 (Plat.); number of tens, hundreds, etc., contained in a number, ii. 354 (Papp.)
- πυραμῖς, ἴδος, ἡ, *pyramid*, 228 (Archim.)
- ῥέπειν, *to incline*; of the weights on a balance, ii. 208
- ῥητός, ἡ, ὄν, *rational*, 398 (Plat.), 452 (Eucl.)
- ρίζα, Ion. ῥίζη, ἡ, *root*; ἀρχικωτάτη ῥίζα, 90 (Nicom.)

INDEX OF GREEK TERMS

ῥομβοειδής, ἑς, *rhombus-shaped, rhomboidal*; ῥ. σχῆμα, 440 (Eucl.)

ῥόμβος, ὁ, *plane figure with four equal sides but with only the opposite angles equal, rhombus*, 440 (Eucl.); ῥ. στερεός, *figure formed by two cones having the same base and their axes in a straight line, solid rhombus*, ii. 44 (Archim.)

Σημαίνειν, *to signify*, 188 (Procl.)

σημεῖον, Dor. σαμεῖον, τό, *point*, 436 (Eucl.); *sign*, ii. 522 (Dioph.)

σκαληνός, ἡ, ὄν, also ὅς, ὄν, *oblique, scalene; κῶνος σ.*, ii. 286 (Apollon.)

σκέλος, οὐς, Ion. εὐς, τό, *leg*; σ. τῆς γωνίας, 264 (Eutoc.)

σπείρα, ἡ, *surface traced by a circle revolving about a point not its centre, spire, tore, torus*, ii. 468 (Heron)

σπειρικός, ἡ, ὄν, *pertaining to a spire, spiric*; σ. τομαί, *spiric sections*, ii. 364 (Procl.); σ. γραμμαί, *spiric curves*, ii. 364 (Procl.)

στερεός, ἄ, ὄν, *solid*; σ. γωνία, *solid angle*, 222 (Plat.); σ. ἀριθμός, *cubic number*;

σ. τοποί, *solid loci*, ii. 600 (Apollon.); σ. πρόβλημα, *solid problem*, 348 (Papp.); σ. νεύσις, *solid verging*, 350 (Papp.); as

subst., στερεόν, τό, *solid*, 258 (Eutoc.)

στοιμή, ἡ, *point*, 80 (Nicom.)
στοιχείον, τό, *element*, ii. 596 (Papp.); *elementary book*, 50 (Procl.); Στοιχεῖα, τά, *the Elements*, especially Euclid's

στοιχείωσις, εὐς, ἡ, *elementary exposition, elements*; Euclid's *Elements of geometry*, 156 (Procl.); αἱ κατὰ μουσικὴν σ., *the elements of music*, 156 (Procl.); σ. τῶν κωνικῶν, *elements of conics*, ii. 276 (Eutoc.)

στοιχειωτής, οὐ, ὁ, *teacher of elements, writer of elements*, esp. Euclid, ii. 596 (Papp.)

στρογγύλος, ἡ, ὄν, *round*, 392 (Plat.)

συγκεῖσθαι, *to lie together*; as pass. of συντιθέναι, *to be composed of*, ii. 284 (Apollon.)

σύγκρισις, εὐς, ἡ, *comparison*; Τῶν πέντε σχημάτων σ., *Comparison of the Five Figures*, title of work by Aristaeus, ii. 348 (Hypsiel.)

συζυγής, ἑς, *yoked together, conjugate*; σ. διάμετροι, σ. ἄξορες, ii. 288 (Apollon.)

σύμμετρος, ὄν, *commensurate with, commensurable with*; 380 (Plat.), 452 (Eucl.), ii. 208 (Archim.)

συμπαταίνειν, *to stretch out alongside of*, 188 (Procl.)

INDEX OF GREEK TERMS

σύνμας, σύνμαςα, σύνμας, *all together, the sum of*, ii. 514 (Dioph.)
 συμπίρασμα, ατος, τό, *conclusion*, ii. 228 (Archim.)
 συμπίπτειν, *to meet*, 220 (Eucl.); τὴν μὲν ἐν αὐτῇ α., *of curves which meet themselves*, ii. 360 (Procl.)
 συμπληροῦν, *to fill, complete*; α. παραλλήλογραμμον, 268 (Eucl.)
 σύμπτωμα, ατος, τό, *property of a curve*, 336 (Papp.)
 σύμπτωσης, εως, ἡ, *falling together, meeting*, ii. 64 (Archim.), ii. 270 (Cleom.), 286 (Eucl.)
 συναγωγή, ἡ, *collection*; title of work by Pappus, ii. 568 (Papp.)
 συναμφοτέρως, ον, *the sum of*, 328 (Archim.)
 συνάπτειν, *to collect, gather*; συνημμένος λόγος, *compound ratio*, ii. 602 (Papp.)
 συνεγγίζειν, *to approximate*, ii. 414 (Ptol.), ii. 470 (Heron)
 σύγγγυς, adv., *near, approximate*, ii. 488 (Heron)
 συνεχής, ἐς, *continued*, 442 (Eucl.); α. ἀναλογία, *continued proportion*, ii. 566 (Papp.); α. ἀνάλογον, 302 (Papp.); σφαῖρα α., ii. 364 (Procl.)
 συνθέντι, v. συντιθέναι
 σύνθεσις, εως, ἡ, *putting together, composition*; α.

λόγου, *transformation of a ratio known as. componendo*, 448 (Eucl.); method of reasoning from assumptions to conclusions, in contrast with analysis, *synthesis*, ii. 596 (Papp.)
 σύνθετος, ον, *composite*; α. ἀριθμός, 68 (Eucl.); α. γραμμή, ii. 360 (Procl.)
 συνιστάναι, *to set up, construct*, 190 (Eucl.), 312 (Them.)
 σύνταξις, εως, ἡ, *putting together in order, systematic treatise, composite volume. collection*; title of work by Ptolemy, ii. 408 (Suidas)
 συντιθέναι, *to place or put together, add together*, used of the *synthesis* of a problem, ii. 160 (Archim.); συνθέντι, lit. *to one having compounded*, the transformation of a ratio known as *componendo*, ii. 130 (Archim.)
 σύστασις, εως, ἡ, *grouping (of theorems)*, 150 (Procl.)
 σφαῖρα, ἡ, *sphere*, 166 (Eucl.), ii. 40 (Archim.), ii. 572 (Papp.)
 σφαιρικός, ἡ, ὄν, *spherical*, ii. 584 (Papp.); Σφαιρικά, title of works by Menelaus and Theodosius
 σφαιροποιία, ἡ, *artificial sphere, making of the heavenly spheres*, ii. 618 (Papp.)

INDEX OF GREEK TERMS

σχῆμα, ατος, τό, *shape, figure*, 438 (Eucl.), ii. 42 (Archim.)

σχηματοποιεῖν, *to bring into a certain form or shape*; σχηματοποιῶσα γραμμή, *curve forming a figure*, ii. 360 (Procl.)

Τάλαντον, τό, *weight known as the talent*, ii. 490 (Heron)

τάξις, εως, ἡ, *order, arrangement, scheme*, 112 (Jambl.)

ταράσσειν, *to disturb*; τεταραγμένη ἀναλογία, *disturbed proportion*, 450 (Eucl.)

τάσσειν, *to draw up in order*, ii. 598 (Papp.); ὁμοίως τεταγμένα, ii. 166 (Archim.); perf. part. pass. used as adv., τεταγμένως, *ordinate-wise*, ii. 286 (Apollon.); αἱ καταγόμεναι τεταγμένως (sc. εὐθεῖαι), *the straight lines drawn ordinate-wise, i.e., the ordinates, of a conic section*, ii. 308 (Apollon.); τεταγμένως ἡ ΓΑ, ii. 224 (Archim.)

τέλειος, α, ον, *perfect, complete*, ii. 604 (Papp.); τ. ἀριθμός, 76 (Simplicius ap. Theol. Arith.), 70 (Eucl.), 398 (Plat.)

τέμνειν, *to cut*; of straight lines by a straight line, ii. 288 (Apollon.); of a curve by a straight line, 278 (Eutoc.); of a solid

by a plane, ii. 288 (Apollon.)

τετταρισκαίδεκάεδρον, τό, *solid with fourteen faces*, ii. 196 (Archim.)

τέτραγμένως, v. τάσσειν
τεταραγμένος, ον, v. ταράσσειν

τεταρτημόριον, τό, *fourth part, quadrant of a circle*, ii. 582 (Papp.)

τετραγωνίζειν, *to make square*, ii. 494 (Heron); *to square*, 10 (Plat.); ἡ τετραγωνίζουσα (sc. γραμμή), *quadratrix*, 334 (Simpl.), 336 (Papp.)

τετραγωνικός, ἡ, ὄν, *square*; of numbers, ii. 526 (Dioph.); τ. πλευρά, *square root*, 60 (Theon Alex.)

τετραγωνισμός, ὁ, *squaring*, 310 (Aristot.); τοῦ κύκλου τ., 308 (Plut.); τοῦ μηνίσκου τ., 150 (Procl.)

τετράγωνος, ον, *square*, 308 (Aristophanes), ii. 504 (Heron); ἀριθμός τ., *square number*, ii. 514 (Dioph.); τ. κρίκοι, *square rings*, ii. 470 (Heron); as subst., τετράγωνον, τό, *square*, 440 (Eucl.); *square number*, ii. 518 (Dioph.)

τετράκις, adv., *four times*, 326 (Archim.)

τετραπλάσιος, α, ον, *four-fold, four times as much*, 332 (Archim.)

τετραπλάσιον, ον, *later form of τετραπλάσιος*

τετράπλευρος, ον, *four-sided*,

INDEX OF GREEK TERMS

- quadrilateral*; σχήματα τ., 440 (Eucl.)
- τιθέναι, *to set, put, place*, ii. 224 (Archim.); θέρεον, *must be posited*, 392 (Plat.); τὸ ΑΒ τεθὲν ἐπὶ τῷ Ζ, Α + Β placed at Ζ, ii. 214 (Archim.)
- τμήμα, Dor. τμήμα, ατος, τό, *segment*; of a circle, ii. 584 (Papp.); of a sphere, ii. 40 (Archim.); in astron., 11th part of diameter of a circle, ii. 412 (Ptol.)
- τομεύς, έως, ό, *sector of a circle*, ii. 582 (Papp.); τ. στερεός, *sector of a sphere* (intercepted by cone with vertex at centre), ii. 44 (Archim.)
- τομή, ή, *end left after cutting, section*; section of a straight line, 268 (Eutoc.); section of a cone, conic section, ii. 278 (Apollon.); τ. ἀντικείμεναι, *opposite branches of a hyperbola*, ii. 322 (Apollon.); σπειρικαί τ., ii. 364 (Procl.); κοινή τ., *common section*, 286 (Eutoc.); Δωρισμένη τ., *Determinate Section*, title of work by Apollonius, ii. 598 (Papp.); τὰ περὶ τὴν τ., *theorems about the section* (of a line cut in extreme and mean ratio), 152 (Procl.)
- τοπικός, ή, όν, *of or pertaining to place or space*; pertaining to a locus, 490 (Papp.); μοῖρα τ., *degree* in space, ii. 396 (Hypsiel.)
- τόπος, ό, *place, region, space*, ii. 590 (Papp.); locus, 328 (Papp.); Τ. ἐπίπεδοι, *Plane Loci*, title of work by Apollonius, ii. 598 (Papp.); Τ. στερεοί, *Solid Loci*, title of work by Aristaeus, ii. 600 (Papp.)
- τραπέζιον, τό, *trapezium*, 410 (Eucl.), ii. 488 (Heron)
- τριάς, άδος, ή, *the number three, triad*, 90 (Nicom.); Μεναιχμεῖαι τ., *the three conic sections of Menaechmus*, 296 (Erat. ap. Eutoc.)
- τρίγωνος, ον, *three-cornered, triangular*; ἀριθμοὶ τρίγωνοι, *triangular numbers*; as subst., τρίγωνον, τό, *triangle*, 440 (Eucl.), 316 (Archim.); τὸ διὰ τοῦ ἑξέως τ. ἵν' αὐτὸ τρίγωνον, ii. 222 (Archim.)
- τριπλάσιος, α-ον, *thrice as many, thrice as great as*, 326 (Archim.), ii. 580 (Papp.)
- τριπλασίων, ον=τριπλάσιος, 320 (Archim.); τ. λόγος, 448 (Eucl.)
- τρίπλευρος, ον, *three-sided, trilateral*; σχήματα τ., 440 (Eucl.)
- τρίχα, thrice, *in three parts*, τ. τεμεῖν τὴν γωνίαν, *to trisect the angle*, 300 (Papp.)
- τυγχάνειν, *to happen to be*; aor. part., τυχών, τυχοῖσα, τυχόν, any, taken at ran-

INDEX OF GREEK TERMS

- dom, εὐθεία τ., ii. 186 (Heron); as adv., τυχόν, perchance, 264 (Eutoc.)
- Ὑδρεῖον, τό, bucket, pitcher; pl., Ὑδρεῖα, title of work on water clocks by Heron, ii. 616 (Papp.)
- ὑπαρξίς, εὖς, ἡ, existence, ii. 518 (Dioph.); positive term, ii. 524 (Dioph.)
- ὑπεναντίος, α, ον, subcontrary; ὁ μέσος, 112 (Archytas ap. Porph.); ὁ τομή, ii. 304 (Apollon.)
- ὑπεναντίως, subcontrary-wise, ii. 301-302 (Apollon.)
- ὑπερβάλλειν, to exceed, 188 (Procl.)
- ὑπερβολή, ἡ, exceeding, 186 (Procl.); the conic section *hyperbola*, so called because the square on the ordinate is equal to a rectangle with height equal to the abscissa applied to the parameter as base, but exceeding (ὑπερβαίνει) it, overlapping, ii. 310 (Apollon.), 186 (Procl.)
- ὑπερέχειν, to exceed, 112 (Archytas ap. Porph.), 444 (Eucl.), ii. 608 (Papp.); τῷ αὐτῷ μέρει τῶν ἄκρων αὐτῶν ὑπερέχον τε καὶ ὑπερεχόμενον, 402 (Plat.)
- ὑπεροχή. Dor. ὑπεροχή, ἡ, excess, 112 (Archytas ap. Porph.), 318 (Archim.), ii. 530 (Dioph.), ii. 608 (Papp.)
- ὑπερπίπτειν, to fall beyond, exceed, ii. 436 (Ptol.)
- ὑπό, by; ἡ ὑπό IIIBB γωνία, the angle IIIBB, 190 (Eucl.); τὸ ὑπὸ ΔΕΓ' (sc. εὐθύγραμμον), the rectangle contained by ΔΕ, ΕΓ', 268 (Eutoc.)
- ὑπόθεσις, εὖς, ἡ, hypothesis, 420 (Aristot.), ii. 2 (Archim.)
- ὑποπολλαπλάσιος, α, ον, submultiple of another; as subst., ὑποπολλαπλάσιον, τό, submultiple, 78 (Theol. Arith.)
- ὑπόστασις, εὖς, ἡ, condition, ii. 534 (Dioph.)
- ὑποτείνειν, to stretch under, subtend, be subtended by; ἡ ὑπὸ δύο πλευρὰς τοῦ πολυγώνου ὑποτείνουσα εὐθεία, the straight line subtending, or subtended by, two sides of the polygon, ii. 96 (Archim.); πλευρὰ ὑποτείνουσα μούρας ξ', side subtending sixty parts, ii. 418 (Ptol.); ἡ τὴν ὀρθὴν γωνίαν ὑποτείνουσα πλευρά, the side subtending the right angle, 178 (Eucl.); hence ἡ ὑποτείνουσα (sc. πλευρὰ ὀρθογώνου), hypotenuse of a right-angled triangle, 176 (Plat.)
- ὑποτιθεῖναι, pass. ὑποκείσθαι, to surmise, assume, make a hypothesis, ii. 2 (Archim.), ii. 304 (Apollon.)
- ὑπίος, α, ον, laid on one's

INDEX OF GREEK TERMS

back, supine; ὑπτιον, τό, a quadrilateral with no parallel sides, 482 (Papp.)

ὑφιστάναί, to place or set under, ii. 362 (Procl.)

ὑψος, οὐς, Ion. εὐς, τό, height; of a triangle, ii. 222 (Archim.); of a cylinder, ii. 42 (Archim.); of a cone, ii. 118 (Archim.)

Φανερός, ἀνὸν, clear, manifest, ii. 64 (Archim.), ii. 570 (Papp.)

φέρειν, to bear, carry; pass., to be borne, carried, move, revolve; σημεῖον φερόμενον, ii. 582 (Papp.); τὸ φερόμενον, moving object, 366 (Aristot.)

φορά, ἡ, motion, 12 (Plat.)

Χεῖρ, χειρός, ἡ, hand or number of men, 30 n. a

χειρουργικός, ἡ, ὄν, manual, ii. 614 (Papp.)

χρονικός, ἡ, ὄν, of or pertaining to time; μοῖρα χ., degree in time, ii. 396 (Hypsiel.)

χωρion, τό, space, area; 394 (Plat.), ii. 532 (Dioph.)

Ψάειν, to touch, 264 (Euloc.)

ψευδάριον, τό, fallacy; Ψευδάρια, τὰ, title of work by Euclid, 160 (Procl.)

Ωρολόγιον, τό, instrument for telling the time, clock, ii. 268 (Euloc.); τὸ δὲ ὕδατος ὦ., water-clock, ii. 616 (Papp.)

ὥς, as; ὥς ἡ ZE πρὸς ΕΓ, ἡ ZH πρὸς ΗΓ, i.e., ZE : ΕΓ = ZH : ΗΓ, 322 (Archim.)

ὥστε, such that, ii. 52 (Archim.); and so, therefore, used for the stages in a proof, ii. 54 (Archim.)
